Subject: LOMR for the Eldorado R1-60 No. 16

Attention: LOMC Manager

G. C. Wallace, Inc. (GCW) has been contracted by Pardee Homes (PH) to complete a Letter of Map Revision (LOMR) for the Eldorado R1-60 No. 16 project within the City of North Las Vegas, Nevada based on CLOMR Case# 14-09-1440R. The project encompasses the reach of an unnamed wash between Deer Springs Way and Centennial Parkway, and west of Revere Street, tying into the existing upstream reinforced concrete arch (RCA) and downstream unnamed wash. The mapping from Deer Springs Way, to east on Deer Springs Way and to south of Deer Springs Way is approximately 2,650 feet long. The purpose of this LOMR is to revise the existing Community Panels to reflect the constructed improvements to protect downstream property and facilities and to revise the FEMA designated Zone A Special Flood Hazard Areas (SFHA). The LOMR methodology is in accordance with *Guidelines and Specifications for Flood Hazard Mapping Partners* (Reference 1).

The current FIRM panel indicates the subject reach of the unnamed wash is located within a Zone A SFHA. The affected Community Panel Map Numbers are 32003C1766F, 32003C1767F, 32003C1768F, and 32003C1769F, revised to reflect LOMR 14-09-0513P, dated March 21, 2014. See Figures 1 and 2 for the project vicinity and location. The Effective FIRM is shown on Figure 3.

The following information supporting this request for a LOMR is enclosed. This request is based on the existing and constructed improvements, which consists of a RCA and channel system that confines the unnamed wash flows. This request is based on 1-foot aerial topography dated October 12, 2013.

Constructed Improvements

Note that all RCA and channel improvements modeling and mapping in support of this LOMR are based on the NAVD88 Datum. See Figure 5 for the location of the constructed improvements included in the attached Section 1.0 Figures and Affected FIRM Panels.

Hydrology

Hydrologic data was referenced from the *1994 Northwest Las Vegas Flood Insurance Study Restudy* (Reference 6, hereinafter refer red to as the *1994 FIS Restudy*). According to the *1994 FIS Restudy*, the unnamed wash effective flowrate is 671 cfs during the 100-year storm event. The reference information is included in the attached Section 5.0 Reference Material.

Aerial Topography and Survey Data

Topographic mapping with a contour interval of 1-foot was generated by AeroTech Mapping (flight date October 12, 2013). The vertical control is based on North American Vertical Datum of 1988 (NAVD 1988), and horizontal control is based on Nevada State Plane Coordinate System (NAD 1983/94).

Hydraulic Modeling

The hydraulic analyses for the project were performed to determine the size and stability of the constructed RCA and channel system. As indicated in the hydrologic analysis, the 100-year design flow rate is 671 cfs.

The *1994 FIS Restudy* and the Eldorado RCL No. 25 LOMR (Case# 14-09-0513P/CLOMR Case# 13-09-1647R) serve as the starting point for the hydraulic analysis for this project. The tasks performed in this study for the existing conditions analysis includes one HEC-RAS model (Section 3.0 Engineering Analysis): (1) construction of the FEMA Effective HEC-RAS model (Effective Model) from the Eldorado RCL No. 25 LOMR to provide the Duplicate Effective HEC-RAS model.

The cross section orientation, location, reach lengths, roughness factors and other modeling parameters remain the same as the submitted Eldorado RCL No. 25 LOMR model for the upstream existing portions. The reference information is included in the attached Section 5.0 Reference Materials. The output from the HEC-RAS models is included in the attached Section 3.0 Engineering Analysis.

Boundary Condition and Floodplain Tie-in Locations

Downstream: The floodplain tie-in location is approximately 1,780 feet downstream of the constructed RCA Headwall. The Duplicate Effective Model results indicate that the flow regime is subcritical.

Upstream: The floodplain tie-in location approximately 870 feet upstream of the constructed RCA Headwall. The Duplicate Effective Model results indicate that the flow regime is subcritical.

Mapping

The 100-year floodplain is based on HEC-RAS modeling for subcritical flow. The floodplain was delineated on topographic maps based on the developed improvements. The top widths calculated in the HEC-RAS model will be contained within the proposed RCA and channel improvements.

The Proposed FIRM revisions are shown on Figure 6 and the Annotated FIRM is shown on Figure 7.

GCW trusts that this submittal will provide the required information needed to support a LOMR for the subject project.

Re: Notification of Widening and Shifting of the 1% Annual Chance Floodplain

Dear Mr. Hale:

The Flood Insurance Rate Map (FIRM) for a community depicts land which has been determined to be subject to a 1% (100-year) or greater chance of flooding in any given year. The FIRM is used to determine flood insurance rates and to help the community with floodplain management.

G. G. Wallace, Inc. (GCW), is applying for a Conditional Letter of Map Revision (CLOMR) from the Federal Emergency Management Agency (DHS-FEMA) on behalf of Pardee Homes to revise FIRM Panels 32003C1766F, 32003C1767F, 32003C1768F, and 32003C1769F for the City of North Las Vegas along an unnamed wash. Pardee Homes is proposing a residential subdivision (Eldorado R1-60 No. 16) as part of the area-wide community master plan.

The CLOMR will result in the following within your property:

1. The floodplain through the property will shift by as much as 800' as a result of the proposed arch culvert extension. The arch culvert will contain the entire 100-year flow. Please refer to the attached annotated FIRM for a graphical representation of the change to the floodplain.

2. The maximum width of the shifted portion of the floodplain is 60.26'.

This letter is to inform you of a proposed revision of the 1% annual chance water-surface elevation and 1% annual chance floodplain on your property south of Deer Springs Way and to certify that no structures are located in areas that would be affected by increases in water surface elevations.

If you have any questions or concerns about the proposed project or its effect on your property, you may contact Mr. Dan Le of the City of North Las Vegas at 2250 Las Vegas Boulevard North, Suite 200, North Las Vegas, NV 89030, during normal business hours.

Dear Mayor Lee:

We are providing our comments in the enclosed Conditional Letter of Map Revision (CLOMR) on a proposed project within your community that, if constructed as proposed, could revise the effective Flood Insurance Rate Map for your community.

COMMENT

This document provides the Federal Emergency Management Agency's (FEMA's) comment regarding a request for a CLOMR for the project described above. This document is not a final determination; it only provides our comment on the proposed project in relation to the flood hazard information shown on the effective National Flood Insurance Program (NFIP) map. We reviewed the submitted data and the data used to prepare the effective flood hazard information for your community and determined that the proposed project meets the minimum floodplain management criteria of the NFIP. Your community is responsible for approving all floodplain development and for ensuring that all permits required by Federal or State/Commonwealth law have been received. State/Commonwealth, county, and community officials, based on their knowledge of local conditions and in the interest of safety, may set higher standards for construction in the Special Flood Hazard Area (SFHA), the area subject to inundation by the base flood. If the State/Commonwealth, county, or community has adopted more restrictive or comprehensive floodplain management criteria, these criteria take precedence over the minimum NFIP criteria.

This comment is based on the flood data presently available. If you have any questions about this document, please contact the FEMA Map Information eXchange (FMIX) toll free at 1-877-336-2627 (1-877-FEMA MAP) or by letter addressed to the LOMC Clearinghouse, 847 South Pickett Street, Alexandria, VA 22304. Additional Information about the NFIP is available on the FEMA website at http://www.fema.gov/business/nfip.

COMMUNITY INFORMATION

To determine the changes in flood hazards that will be caused by the proposed project, we compared the hydraulic modeling reflecting the proposed project (referred to as the proposed conditions model) to the hydraulic modeling reflecting the existing conditions.

The table below shows the changes in the base flood water-surface elevations (WSELs).

Base Flood WSEL Comparison Table

Flooding Source:		Base Flood WSEL Change (feet)	Location of maximum change
Proposed vs. Existing	Maximum increase	10.7	Approximately 830 feet upstream of Revere Street
	Maximum decrease	None	N/A

NFIP regulations Subparagraph 60.3(b)(7) requires communities to ensure that the flood-carrying capacity within the altered or relocated portion of any watercourse is maintained. This provision is incorporated into your community's existing floodplain management ordinances; therefore, responsibility for maintenance of the altered or relocated watercourse, including any related appurtenances such as bridges, culverts, and other drainage structures, rests with your community. We may request that your community submit a description and schedule of maintenance activities necessary to ensure this requirement.

This comment is based on the flood data presently available. If you have any questions about this document, please contact the FEMA Map Information eXchange (FMIX) toll free at 1-877-336-2627 (1-877-FEMA MAP) or by letter addressed to the LOMC Clearinghouse, 847 South Pickett Street, Alexandria, VA 22304. Additional Information about the NFIP is available on the FEMA website at http://www.fema.gov/nfip.

Upon completion of the project, your community must submit the data listed below and request that we make a final determination on revising the effective FIRM. If the project is built as proposed and the data below are received, a revision to the FIRM would be warranted.

• Form 1, entitled "Overview & Concurrence Form." Detailed application and certification forms must be used for requesting final revisions to the maps. Therefore, when the map revision request for the area covered by this letter is submitted, Form 1 must be included. If as-built conditions differ from the proposed plans, please submit new forms, which may be accessed at http://www.fema.gov/plan/prevent/fhm/dl_mt-2.shtm, or annotated copies of the previously submitted forms showing the revised information.

• Hydraulic analyses, for as-built conditions, of the base flood together with a topographic work map showing the revised floodplain boundaries. Please ensure that the revised information ties into the currently effective information at the downstream and upstream ends of the revised reach.

• An annotated copy of the FIRM, at the scale of the effective FIRM, that shows the revised floodplain boundary delineations shown on the submitted work map and how they tie into the floodplain boundary delineations shown on the current effective FIRM at the downstream and upstream ends of the revised reach

• As-built plans, certified by a registered professional engineer, of all proposed project elements

• Documentation of the notification to property owners who will be affected by any widening/shifting of the base floodplain and/or any BFE increases along Unnamed Wash.

This comment is based on the flood data presently available. COMMUNITY INFORMATION (CONTINUED)

• Please provide evidence that the project has complied with all terms and conditions of the incidental take permit outlined in the Biological Opinion (TE034927-0) from the U.S. Fish and Wildlife Service (USFWS) dated January 9, 2001.

• FEMA's fee schedule for reviewing and processing requests for conditional and final modifications to published flood information and maps may be accessed at http://www.fema.gov/plan/prevent/fhm/frm_fees.shtm. The fee at the time of the map revision submittal must be received before we can begin processing the request. Payment of this fee can be made through a check or money order, made payable in U.S. funds to the National Flood Insurance Program, or by credit card (Visa or MasterCard only). Please forward the payment, along with the revision application, to the following address:

LOMC Clearinghouse
847 South Pickett Street
Alexandria, VA 22304

After receiving appropriate documentation to show that the project has been completed, FEMA will initiate a revision to the FIRM. Because the flood hazard information (i.e., base flood elevations, base flood depths, Special Flood Hazard Areas, zone designations, and/or regulatory floodways) will change as a result of the project, a 90-day appeal period will be initiated for the revision, during which community officials and interested persons may appeal the revised flood hazard information based on scientific or technical data.

Re: Technical Drainage Study for Eldorado R1-60 No. 16
CNLV No. 47525

Dear Jerry:

CNLV staff has reviewed the above referenced expedited study, dated November 18, 2013, and Addendum #1, dated November 25, 2013 and found it to meet the minimum accepted standards for a technical drainage study. This acceptance is contingent upon the following conditions:

1. Concurrence must be obtained by the Clark County Regional Flood Control District (CCRFCD) since the proposed project lies within FEMA flood zone "A". Please submit a copy of this study and all addenda to CCRFCD upon acceptance from CNLV.

2. The following requirements must be met for construction within FEMA designated Special Flood Hazard Area:

   -Grading and off-site construction permits will only be issued by the CNLV Department of Public Works once the improvement plans and drainage study have been approved **and** a copy of the completed Conditional Letter of Map Revision (CLOMR) application has been submitted to FEMA for processing.
   -Building permits can be issued once a favorable CLOMR has been obtained from FEMA.
   -Certificate-of-occupancy will only be issued once a Letter of Map Revision (LOMR) has been obtained from FEMA.

3. Please coordinate with Duane McNelly, Development and Flood Control Project Leader, when submitting improvement plans for this project. Mr. McNelly can be reached at 633-2312.

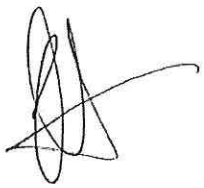
Please be advised that all land surface area disturbances over 1 acre and/or adjacent to a water way must submit a "Notice of Intent" to discharge to the Nevada Division of Environmental Protection, which certifies that a stormwater pollution prevention plan has been developed and is maintained on site. For more information, including forms and applications, see http://ndep.nv.gov/bwpc/storm01.htm.

Acceptance of this drainage study does not imply approval of the grading plan or the structural calculations associated with the drainage for this site. A detailed review of the grading plan will be performed by staff during the improvement plan review process.

Any future changes in the proposed design (or design assumptions) as outlined in the approved drainage study and the attached preliminary grading plan which affect drainage must be addressed in a Drainage Study Amendment and accepted by the CNLV Development and Flood Control Section. Additionally, conditional acceptance of a drainage study is valid for a period of one (1) year. If the proposed construction has not been completed in that time period, CNLV reserves the right to require additional conditions and/or submission and acceptance of a complete drainage study update prior to further construction of a project.

CNLV, its officials, or employees assume no liability for information, data, calculations and conclusions presented by the consulting engineers. We, therefore, make no warranties, either expressed or implied, in conducting this review. If you have any questions concerning this matter, please contact me at 633-1932.)633-1932.

Sincerely,



Dan Le, P.E., CFM

F. SEDIMENT TRANSPORT

Flooding Source: _____

Name of Structure: _____

If there is any indication from historical records that sediment transport (including scour and deposition) can affect the Base Flood Elevation (BFE); and/or based on the stream morphology, vegetative cover, development of the watershed and bank conditions, there is a potential for debris and sediment transport (including scour and deposition) to affect the BFEs, then provide the following information along with the supporting documentation:

Sediment load associated with the base flood discharge: Volume _____ acre-feet

Debris load associated with the base flood discharge: Volume _____ acre-feet

Sediment transport rate _____ (percent concentration by volume)

Method used to estimate sediment transport: _____

Most sediment transport formulas are intended for a range of hydraulic conditions and sediment sizes; attach a detailed explanation for using the selected method.

Method used to estimate scour and/or deposition: _____

Method used to revise hydraulic or hydrologic analysis (model) to account for sediment transport: _____

Please note that bulked flows are used to evaluate the performance of a structure during the base flood; however, FEMA does not map BFEs based on bulked flows.

If a sediment analysis has not been performed, an explanation as to why sediment transport (including scour and deposition) will not affect the BFEs or structures must be provided.

B. #4 – Based on the local topography, soil type, and cover, it is assumed that sediment transport will not have a significant impact on the results of the hydrologic or hydraulic calculations. In addition, the overall design is a closed conduit system. Because there is no opportunity for sediment to build up inside the proposed system, sedimentation was not considered for design.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth
for the water surface and continued on with the calculations.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.
This may indicate the need for additional cross sections.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the
need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated

water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program
defaulted to critical depth.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth
for the water surface and continued on with the calculations.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated
water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program
defaulted to critical depth.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth
for the water surface and continued on with the calculations.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.
This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated
water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program
defaulted to critical depth.

NT RC 05	The left overbank n-value of $nlob$ and the right overbank n-value of $nrob$ are less than or equal to the channel n-value of nch. Follow the procedure in (FHWA, 1984) to compute the n-value for the natural floodplain and the channel. Or follow the procedure in (USGS, 1977) to compute the n-value for urban development. Please submit supporting information on the evaluation of n-values.	4993; 5043; 5404; 5596; 5901	N-VALUES ARE BASED ON EFFECTIVE FIRM MODEL.
NT TL 02	Contraction and expansion loss coefficients are cc and ce, respectively. However, this cross section is not at a hydraulic structure. They should be equal to 0.1 and 0.3 according to page 5-8 of the HEC-RAS Hydraulic Reference Manual (HEC, 2010).	2954; 4993; 5043	THESE SECTIONS ARE LOCATED IMMEDIATELY UPSTREAM OR DOWNSTREAM OF HYDRAULIC STRUCTURES.
XS DC 02	Constant discharge used for the entire profile for $assignedname$ flood. At least two discharges should be selected; one at the mouth and the other at the middle of the watershed or above the confluence of a tributary. Or provide explanation why only one discharge should be used. Other flood frequencies should also be checked.		FLOW RATE IS THE EFFECTIVE FLOW RATE THROUGH THE ENTIRE REACH.
XS EC 01L	Cross section extended vertically. Flow Code will be EL. The $assignedname$ WSEL of $wsel$ is higher than the starting GR station elevation of $grelv$. The Left_Sta_Eff is equal to the starting GR station. If there is divided flow then cross section should be trimmed or the ineffective flow station should be used to block the divided flow. If there is no divided flow then the cross section should be expanded to cover the $assignedname$ floodplain.The HEC-RAS geometry file may need to be recreated using a GIS program. Or provide explanation why the cross section should not be expanded.	2954; 3032; 3132; 3390; 3818; 3939; 4141; 4343; 4600; 4857; 4870; 4880; 4950; 4960	THESE SECTIONS MODEL AN ARCH CULVERT WITH VERTICAL WALLS.

XS EC 01R	Cross section extended vertically. Flow Code will be ER. The $assignedname$ WSEL of $wsel$ is higher than the ending GR station elevation of $grelv$. The Rght_Sta_Eff is equal to the ending GR station. If there is divided flow then the cross section should be trimmed or the ineffective flow station should be used to block the divided flow. If there is no divided flow then the cross section should be expanded to cover the $assignedname$ floodplain. The HEC-RAS geometry file may need to be recreated using a GIS program. Or provide explanation why the cross section should not be expanded.	2954; 3032; 3132; 3390; 3818; 3939; 4141; 4343; 4600; 4857; 4870; 4880; 4950; 4960	THESE SECTIONS MODEL AN ARCH CULVERT WITH VERTICAL WALLS.
XS GD 01	'Cross Section Lid' option is used for this section. Instead, the bridge or culvert option should be used. Cross Section Lid option may be used to model small obstructions, such as, pipe crossing or if the type of flow through the lid sections and the main stream is in super critical flow, or if there is lateral weir flow between Sections 3 and 2 of a structure.	2954; 3032; 3132; 3390; 3818; 3939; 4141; 4343; 4600; 4857; 4870; 4880; 4950; 4960	THE LID OPTION WAS USED SINCE THE FLOW THROUGH THE CULVERT IS SUPER-CRITICAL.
