EXECUTIVE SUMMARY

RECD

PREFACE

On behalf of Clark County (Community No. 320003), this report and supporting information has been assembled in the preparation of the application for a Letter of Map Revision (LOMR) for a portion of the Flamingo Wash located in Section 28, Township 21 South, Range 60 East, Clark County, Nevada. With this application, Clark County requests revision to a portion of the Special Flood Hazard Area (SFHA), designated Zone A on FIRM 32003C, Panel No. 2535D. The revision requested is based on operation of the Upper Flamingo Wash Detention Basin (UFWDB) and the Southern Vista Estates (SVE) Diversion Berm and Channel.

This application is a resubmittal to the Federal Emergency Management Agency (FEMA) based on FEMA's review comments to an initial application for Conditional Letter of Map Revision (CLOMR) in March 1993. The original application was assigned FEMA Case No. 93-09-407R. The review comments provided by FEMA (letter received August 27, 1993) requested that additional analysis and information pertaining to UFWDB and the SVE Diversion be provided.

UPPER FLAMINGO WASH DETENTION BASIN

The UFWDB was originally designed by Black & Veatch to attenuate the 100-year flood from a 21-square mile upstream watershed. The original design storm produced a peak inflow of 5450 cfs into the detention basin, and a corresponding peak discharge of 1225 cfs. However, changes in land use, planning, and development have resulted in the incremental diversion of flows from the lower Red Rock watershed southward towards UFWDB. Likewise, construction of the SVE Development and associated diversion berm and channel have also served to increase the drainage area tributary to the UFWDB.

In the letter dated August 27, 1993, FEMA specifically requested that an analysis be completed to evaluate the impact of flow diversion from the Red Rock watershed south along Durango into the UFWDB. To respond to FEMA's request, a "new Base Flood Event" was established to evaluate the performance of the UFWDB for such an occurrence. Because of the uncertainty in predicting the portion of Red Rock floodwaters that will reliably be diverted into UFWDB, the

new Base Flood Event is based on the assumption that all flow from the lower Red Rock watershed, including the Red Rock Detention Basin outflow, are routed through the UFWDB.

The new Base Flood Event produces a total runoff hydrograph volume of 1448 acre-feet and a peak inflow of 6660 cfs into the UFWDB, which results in spillway overtopping of 0.5 ft or less for a period of 5.5 hours. These results include provisions for 105 acre-feet of sediment storage and account for the additional basin storage volume available due to the ongoing aggregate mining operations.

The UFWDB discharge channel was originally designed for a 100-year peak discharge of 1225 cfs, and the channel was constructed with an additional 2 to 3 feet of freeboard above the 100-year water surface elevation. For the new Base Flood Event, the total peak discharge from the detention basin (including outlet works and spillway discharge) is 2579 cfs. This peak outflow exceeds the capacity of the existing discharge channel and will result in shallow depth, overbank flooding of the adjacent undeveloped lowlands. However, the width of the resulting flood plain for the new Base Flood Event is less than that depicted on the current FIRM.

The structural and geotechnical basis of design for the UFWDB was originally based on the Probable Maximum Flood (PMF) event. In review of the original design, it is concluded that the UFWDB is stable and suitable for operation during flood events in excess of the new Base Flood Event.

SOUTHERN VISTA ESTATES DIVERSION CHANNEL AND BERM

The SVE Diversion Channel and Berm was designed by Engineers and Surveyors, Inc., and constructed in conjunction with the Southern Vista Estates development project. The diversion channel and berm function as an extension of the UFWDB embankment and are intended to collect and divert flows from approximately 520 acres of undeveloped land into the UFWDB.

The downstream section of the SVE diversion consists of an unlined trapezoidal channel. Based on review of the original design information and subsequent evaluation performed for this submittal, the channel section has adequate capacity to convey the peak 100-year discharge of

approximately 690 cfs. Available freeboard above the peak 100-year water surface elevation ranges from 0.4 to 1.1 feet.

The upstream section of the SVE diversion consists of a flat-sloped, low-height earthen berm. The upper reach of the berm is subject to 100-year peak discharges of 490 cfs. Additional drainage tributary to the lower reach of the berm increases the 100-year peak flow to approximately 650 cfs. The available freeboard above the 100-year water surface elevation for the berm ranges from 1.8 to 3.0 feet.

The SVE diversion is a local drainage improvement and not a regional facility. The channel and berm are intended to provide protection to the SVE developments from stormwater runoff from a small, defined, and predictable watershed. Although the available freeboard for the SVE facilities is less than required by NFIP 44CFR 65.10, the facilities are of adequate capacity and integrity to convey the 100-year flood to the UFWDB and should therefore, protect the SVE developments as was the original design intent.

CONCLUSION

The limits of the SFHA on the current and previous FIRM in the vicinity of the UFWDB appear to be interpretive based on early studies and mapping efforts. The revised limits of the SFHA requested with this application for a LOMR are also somewhat interpretive due to the complexity of determining exact floodplain limits resulting from the UFWDB spillway overtopping. However, it is apparent that operation of the UFWDB and discharge channel will significantly reduce the limits of downstream floodways.

INTRODUCTION

BACKGROUND

This report is a compilation of the Technical Memorandums prepared by Black & Veatch in response to FEMA's review comments on a previous submittal prepared by Mr. Thomas Granillo, P.E., of Landmark Engineering, Inc. The previous submittal by Mr. Granillo was in pursuit of a CLOMR to remove the Southern Vista Estates development project from a Special Flood Hazard Area designated Zone A on FIRM 32003C, Panel No. 2535D. At the time of the initial review, FEMA Case No. 93-09-407R was assigned to this request.

On behalf of Clark County (Community No. 320003), the Clark County Regional Flood Control District (CCRFCD) and Black & Veatch have prepared this resubmittal in pursuit of a LOMR for in-place operation of both the Upper Flamingo Wash Detention Basin (UFWDB) and the Southern Vista Estates (SVE) Diversion Berm and Channel. In the response letter to Mr. Granillo's submittal, FEMA specifically identified questions and comments regarding the design and function of the UFWDB and the SVE diversion project. This resubmittal package includes this compilation report, copies of supplementary reports, As-Built drawings, construction test results, and the appropriate Application Certification forms in an effort to provide FEMA with the additional information needed to complete the processing of this case.

UPPER FLAMINGO WASH DETENTION BASIN

Black & Veatch provided the design and construction administration services to Clark County Department of Public Works for the UFWDB and discharge channel. The facility was originally designed to attenuate peak flows from a 21-square mile drainage area. The original design of the facility was based on a 100-year flood which produced a peak inflow of 5450 cfs resulting in a peak discharge through the low level outlet of 1225 cfs.

Construction of the UFWDB project, including the discharge channel, was completed by Wheeler Construction, Inc. on February 21, 1992. The as-built conditions of the project were verified by the contractor's surveyor, and the work was certified by the Project Manager, Dana V. Reel, P.E., to be constructed in accordance with the As-Built plans and specifications.

The As-Built plans of the UFWDB and a QA/QC report, consisting of all the soils and concrete tests, were submitted to the State of Nevada, Department of Conservation and Natural Resources on July 6, 1992. The Clark County Department of Public Works received authorization from the State on July 14, 1992, to impound stormwater flows behind the UFWDB.

SVE DEVELOPMENT PROJECT

Subsequent to the completion of the UFWDB, the Southern Vista Estates development project was designed and constructed. The SVE project included single family housing and a condominium complex. The SVE development site was subject to stormwater runoff from approximately 520 acres of land located southwest of the planned development. To eliminate the need for conveyance facilities through the SVE site for this offsite drainage, the developer constructed a diversion berm and channel to redirect the offsite drainage into the UFWDB. The SVE diversion berm and channel was designed by Engineers and Surveyors Inc. (ESI) in late 1992. The upstream end of the SVE diversion project begins approximately 2600 feet south of the UFWDB, and extends due north 1000 feet as a low height berm at which point the cross section transforms from a berm to a channel section. The channel section continues north 1630 feet and discharges into the UFWDB at the south end of the detention basin embankment.

ESI's design was approved by the Clark County Department of Public Works and CCRFCD in conjunction with the Southern Vista Estates Condominium development project. Construction of the SVE diversion berm and channel was completed in 1993. A copy of ESI's design report, design drawings, and a letter from ESI certifying the as-built condition of the diversion berm and channel are included with this submittal.

OVERVIEW

With regard to the UFWDB, FEMA has specifically requested that an analysis be completed to evaluate the impact of flows diverted south along Durango Drive, from Red Rock Wash to the UFWDB. In response to this inquiry, and in evaluation of the information submitted with this request, the flows are defined as follows:

- All flows from the Red Rock Detention Basin, as it existed in 1995, and from portions of the Red Rock watershed downstream of the detention basin are diverted into the UFWDB.

- Runoff from 15.9 square miles of the Flamingo Wash watershed are routed into the UFWDB.

The resulting inflow hydrograph into UFWDB is referred to throughout this report as the "new Base Flood Event." The assumptions in the determination of this new Base Flood Event reflect conservatism based on the following:

- A storm centered such that it would produce a flood in the Red Rock Wash capable of overtopping the Red Rock Detention basin emergency spillway, concurrent with a 100-year flood on the Flamingo Wash watershed is unlikely.

- The capacity and reliability of the improvements that serve to divert Red Rock flows south along Durango Drive are questionable.

This compilation report consists of six technical memorandums or sections that summarize the investigations and analyses related to the following subject matter:

- *Base Hydrology* - Summary of the initial HEC-1 analysis to establish the new Base Flood Event into UFWDB.

- *Sedimentation Analysis* - Summary of the analysis and discussion of results with respect to COE estimates for annual and new Base Flood Event sediment delivery to UFWDB.

- *UFWDB Performance Analysis* - Summary of the UFWDB performance for new Base Flood Event which accounts for increased basin storage due to ongoing mining operations and provisions for sediment storage.

- *Embankment and Spillway Stability* - Summary of the design parameters and procedures used in the original design of the UFWDB embankment and spillway. Comparison of original design parameters with those for the new Base Flood Event.

- *Discharge Channel Analysis* - Summary of the HEC-2 analysis for the UFWDB discharge channel under the new Base Flood Event and discussion of resulting flood zone.

- *SVE Diversion Channel and Berm* - Summary of the design and performance of the SVE diversion project for the 100-year event.

The LOMR Application/Certification forms follow the report. A revised floodplain was established based on the findings of this report and is shown on the aerial map included with this submittal.

CERTIFIED MAIL
RETURN RECEIPT REQUESTED

IN REPLY REFER TO:
Case No.: 93-09-407R

The Honorable Jay Bingham
Chairman, Clark County Board
of Commissioners
225 Bridger Avenue
Las Vegas, Nevada 89155

Community: Clark County, Nevada
(unincorporated areas)
Community No.: 320003

104

Dear Mr. Bingham:

With a letter dated July 26, 1993, Mr. Thomas Granillo, P.E., Landmark Engineering, submitted additional data to support a request for a Conditional Letter of Map Revision (CLOMR) to the effective Flood Insurance Rate Map (FIRM) for the unincorporated areas of Clark County, Nevada, dated September 29, 1989. The initial request was submitted by Mr. Granillo with a letter dated March 30, 1993.

It is our understanding that the base (100-year) flood from Flamingo Wash is being intercepted and detained by the existing Upper Flamingo Wash Detention Basin (UFWDB). The UFWDB is located southeast of the intersection of Durango Drive and Hacienda Avenue. The base flood is conveyed from the UFWDB past the proposed Southern Vista Estates subdivision by way of channel improvements along Flamingo Wash from the outlet of the UFWDB downstream to Hacienda Avenue. In addition, a proposed diversion channel will extend approximately 2,900 feet south from the southern end of the UFWDB embankment in order to divert the base flood from an unnamed wash into the UFWDB, thereby providing protection to the proposed subdivision. The area of concern is currently within the Special Flood Hazard Area (SFHA) designated as Zone A on the FIRM.

All data required to evaluate this request were submitted by Mr. Granillo with his letters dated March 30 through July 26, 1993. All fees necessary to process this request (a total of $2,500) have been received.

We have completed our review of the data submitted and can provide you with the following comments regarding the UFWDB and the proposed diversion channel. In order for us to revise the FIRM to reflect UFWDB's ability to provide base flood protection, we require submission of the data listed below:

- Analysis that evaluates the impact of flows diverted south along Durango Drive, from Red Rock Wash, on the UFWDB
- Engineering analysis that evaluates the impact of the sediment load associated with the base flood on the UFWDB

- Geotechnical and structural analyses that evaluate the stability and structural integrity of the embankment and outlet structure of the UFWDB during the base flood event on Flamingo Wash

- A topographic work map, certified by a registered professional engineer, showing the 100-year floodplain as computed by the HEC-2 hydraulic computer model for the channel improvements from the UFWDB outlet structure to Hacienda Avenue

- As-built plans, certified by a registered professional engineer, for the UFWDB and the channel improvements that extend from the UFWDB outlet structure to Hacienda Avenue

- An officially adopted maintenance and operation plan for the UFWDB. This plan may be in the form of a written statement from the community Chief Executive Officer, an ordinance, or other legislation. The plan should include information regarding the nature of the maintenance activities, the frequency with which they will be performed, and the title of the local community official who will be responsible for ensuring that the maintenance activities are accomplished.

However, after the SFHA designation is removed from areas protected by the UFWDB, the proposed subdivision will still be subject to flooding from the unnamed wash that crosses the subdivision property.

With regards to the diversion channel, if the channel is constructed as described in the report entitled "Southern Vista Estates Request for a Combined Conditional Letter of Map Revision (CLOMR) & Letter of Map Revision (LOMR)," dated May 1993, prepared by Landmark Engineering, Inc., and if the following requirements are met, then we will recognize the channel as protecting the proposed subdivision from the base flood from the unnamed wash. These requirements are as follows:

- Engineering analysis that evaluates the impact of the sediment load associated with the base flood on the proposed diversion channel

- Engineering analyses and an operation and maintenance plan that demonstrate that the berms along the proposed diversion channel meet the requirements set forth in Section 65.10 of the National Flood Insurance Program (NFIP) regulations

- As-built plans, certified by a registered professional engineer, of the proposed diversion channel and all improvements constructed as a part of the proposed Southern Vista Estates subdivision

- An as-built hydraulic analysis of the base flood along the proposed diversion channel.

As stated above, upon receipt of the required data regarding the UFWDB, we will initiate a revision to the FIRM to reflect the protection provided by the UFWDB. However, in order to

entirely remove the SFHA designation from the proposed Southern Vista Estates subdivision, we must also receive the required data regarding the proposed diversion channel.

Our review and findings are for the sole purpose of establishing risk zone determinations for NFIP maps, and will not constitute a determination by the Federal Emergency Management Agency (FEMA) as to how the flood control measure will perform in an actual flood event.

The basis of this CLOMR is, in part, a proposed channel modification project. Paragraph 60.3(b)(7) of the NFIP regulations requires that communities "assure that the flood-carrying capacity within the altered or relocated portion of any watercourse is maintained." This provision is incorporated into your community's existing floodplain management regulations. Consequently, your community must agree to accept responsibility for the maintenance of the modified channel before allowing its construction.

This response to Mr. Granillo's request is based on minimum floodplain management criteria established under the NFIP. Your community is responsible for approving all proposed floodplain development, including this request, and for assuring that the necessary permits required by Federal or State law have been received. State and community officials, based on knowledge of local conditions and in the interest of human safety, may set higher standards for construction or may limit development in floodplain areas. If the State of Nevada or Clark County has adopted more restrictive or comprehensive floodplain management criteria, those criteria take precedence over the minimum NFIP requirements.

Should you have any questions regarding this matter, please contact the Chief, Natural and Technological Hazards Division of FEMA in San Francisco, California, at (415) 923-7175, or Mr. John Magnotti of my staff in Washington, DC, at (202) 646-3932, or by facsimile at (202) 646-3445.

Sincerely,

William R. Locke
Chief, Risk Studies Division
Federal Insurance Administration

Clark County Regional Flood Control District

BASE HYDROLOGY

SCOPE

Black & Veatch established a new Base Flood Event for the UFWDB in accordance with FEMA's letter dated August 27, 1993. In response to FEMA Case No. 93-09-407R, the existing *Flood Insurance Study* (FIS) HEC-1 model was revised to divert flows from the Red Rock watershed south along Durango Drive and into the UFWDB. The new Base Flood Event is used in subsequent investigations discussed in the following sections of this submittal.

DISCUSSION

The development of the new Base Flood Event was based on the existing *Flood Insurance Study* (FIS) HEC-1 computer model as developed by James M. Montgomery Engineers in 1991. The model reflects a hydrologic adjustment for calibration with the U.S. Army Corps of Engineers' *Feasibility Study*. To determine the new Base Flood Event, the following modifications were made to the FIS model for this analysis:

- Outfall from the Red Rock Detention Basin was routed through the UFWDB.
- Runoff from 1.51 square miles of Subbasin R6 into the UFWDB was deleted since this area has since been developed with the Spanish Trail community and runoff is diverted elsewhere.
- With the UFWDB as the point of interest, the tributary drainage area is 87.6 square miles. A corresponding depth area reduction factor (DARF) of 0.62 was used for this analysis.

It should be noted that the UFWDB operational parameters were not modified in the revised HEC-1 model as this did not influence the new Base Flood Event. The UFWDB operational parameters represent the As-Built facility. Modifications to the storage capacity of the basin are discussed in the UFWDB PERFORMANCE ANALYSIS Section.

NEW BASE FLOOD EVENT

The revised HEC-1 model produced a new Base Flood Event with a peak inflow to the UFWDB of 6660 cfs. The UFWDB peak inflow includes 5429 cfs routed from the Red Rock Detention Basin spillway and outfall. It also includes runoff from subbasins downstream of the Red Rock Detention Basin in addition to the 15.9 square mile Upper Flamingo Wash watershed. The revised routing from the Red Rock Detention Basin and downstream subbasins produces a peak inflow which represents a worst-case scenario for the UFWDB.

HEC-1 MODEL RESULTS

Using the As-Built operational parameters for the UFWDB, the peak reservoir stage reaches 2471.15 feet for the 100-year storm, which exceeds the spillway elevation of 2470.50 feet. This results in low head spillway overtopping for a period of approximately nine hours with depths ranging from 0 to 0.65 feet. The HEC-1 results for the modified FIS model are listed below.

Peak Inflow	6660 cfs	Peak Spillway Discharge	1670 cfs
Peak Outflow	2962 cfs	Peak Reservoir Stage	2471.15 ft
Peak Orifice Discharge	1292 cfs	Peak Storage	1056.4 ac-ft

CONCLUSION

The FIS hydrologic model of the Upper Flamingo and Red Rock watersheds was modified to represent rerouted flows, current development conditions, and points of interest. The revised FIS HEC-1 model produces a new Base Flood Event with a peak inflow of 6660 cfs. Subsequent sections of this submittal take into account the sediment loading and storage capacity changes in the UFWDB impoundment area which affect the performance of the facility.

SEDIMENTATION ANALYSIS

SCOPE

Black & Veatch evaluated the sediment load impact on the UFWDB by determining average annual and 100-year event sediment production using the Universal Soil Loss Equation (USLE) and the Modified Universal Soil Loss Equation (MUSLE) methods. Sedimentation analysis results were then compared to the U.S. Army Corps of Engineers' adopted values.

DISCUSSION OF PARAMETERS

The following discussion defines the variables used in the USLE and MUSLE methods for estimating sediment loads delivered to the Upper Flamingo Wash Detention Basin.

Universal Soil Loss Equation (USLE)

The Universal Soil Loss Equation, developed by the USDA Soil Conservation Service, is one method for predicting the gross sediment amount produced by sheet and rill erosion. The following equation was used to predict values for average annual or single storm erosion:

$$A = RKLSCP$$

Where, A = Soil loss / unit area (tons/acre),
R = Rainfall factor,
K = Soil erodibility factor,
LS = Length-slope factor,
C = Vegetal cover factor, and
P = Conservation practice factor.

The dimensionless factors that comprise the equation take into account the characteristics of the watershed. Several authors were referenced to determine the most representative values for the UFWDB watershed. A summary of the factor selection and range of values considered for use in the USLE follows.

Rainfall Factor (R). The rainfall factor is a product of a rainfall's kinetic energy and its maximum 30-minute intensity, and represents the erosive forces of falling rain and runoff. The R value for the average annual erosion is based on a 2-year, 6-hour precipitation depth. Reference 9 (Table A) listed the annual R value for Las Vegas as 15, whereas a value of 27 was derived from figures or equations in References 1 and 6.

The following equation was used to calculate the R value for the Base Flood (100-year, 6-hour) event.

$$R_{100} = \frac{19.25P^{2.2}}{D^{0.4672}} \qquad \text{(Ref. 1)}$$

Where, R_{100} = Rainfall factor for 100-year, 6-hour storm,
P = Depth of precipitation (inches), and
D = Storm duration (hours).

The 100-year, 6-hour precipitation depth of 2.3 inches was adjusted to 3.3 inches in accordance with Reference 3, thereby producing an R value of 115.24. This was the only R value used for 100-year event calculations.

Soil Erodibility Factor (K). The K factor represents a soil's susceptibility to erosion or its resistance to detachment by rainfall and runoff. Several references estimate K values as a function of soil textures, gradation, and permeabilities. Soil characteristics for the Upper Flamingo watershed were obtained from the geotechnical investigation (Ref. 5) performed during the 1989 design of the UFWDB. Values for the K factor did not vary greatly among the references consulted. The K values used in the USLE calculations ranged from 0.13 to 0.17 for each subbasin.

Length-Slope Factor (LS). The LS factor describes the combined effect of the length and steepness of the watershed slope on the runoff energy. The LS value was calculated using the following equation:

$$LS = \left(\frac{\lambda}{72.6}\right)^{m}\left(\frac{430x^2 + 30x + 0.43}{6.613}\right) \quad \text{(Ref. 1)}$$

Where, λ = Slope length (ft),
x = Slope gradient (ft/ft), and
m = 0.3 for $x \leq 3\%$, 0.4 for $x = 4\%$, and 0.5 for $x \geq 5\%$.

The LS factor was calculated for the individual subbasins and then averaged over the watershed area to obtain an overall LS value of 8.48. The overall value was used in the basic USLE computations and MUSLE lumped parameter method.

Vegetal Cover Factor (C). Sometimes called the Crop Management Factor, the C factor is dependent on the type and density of plant cover. The Soil Conservation Service has compiled a table for "Permanent Pasture, Rangeland, and Idle Land" (References 1, 6, and 9) from which to estimate the C value based on the percentage of canopy and ground cover. Other tables exist for disturbed or altered lands, such as construction or agricultural sites.

The Upper Flamingo watershed is considered idle land with a random distribution of vegetation in the form of short brush and/or tall weeds over as much as 25 percent of the area, and a ground cover of weeds over 20 percent or less of the area. Each subbasin was estimated separately. Subbasins located low on the alluvial fan, or with a majority of their area comprised of washes, were rated as having no appreciable canopy or ground cover. Subbasins located midway up the fan were rated as having no canopy and 20 percent ground cover, and the remaining subbasins were estimated to have 25 percent canopy and 20 percent ground cover. The following C values were obtained from the SCS table:

Subbasin Description	Canopy Cover %	Ground Cover %	C Value
Lower fan/wash	0	0	0.45
Middle fan	0	20	0.24
Upper fan	25	20	0.20

Individual subbasin C values were weighted over the watershed area yielding 0.28 as an average C value for the watershed.

Conservation Practice Factor (P). Often used in conjunction with the C factor, the P factor is a ratio of soil loss under a certain erosion control practice, such as contour farming, to the soil loss resulting from straight-row farming. A default value of 1.0 is used for non-crop land such as the Upper Flamingo watershed.

As defined above, the USLE accounts for the detachment and transport effects of rainfall, but does not account for significant amounts of deposition within the watershed. Therefore, the sediment loading values obtained from the USLE are gross amounts and not a computed value of sediment yield.

Modified Universal Soil Loss Equation (MUSLE)

To estimate the sediment yield directly for a specific storm event, the USLE is modified by replacing the rainfall factor R with the product of runoff volume and peak discharge. The MUSLE is defined as follows:

$$Y = 95\,(Q \times V)^{0.56}\, K\, LS\, CP \qquad \text{(Ref. 7)}$$

Where, Y = Single storm sediment yield (tons),
Q = Peak discharge (cfs),
V = Runoff volume (ac-ft), and
K, LS, and CP are as defined under USLE section.

The MUSLE method may be applied to a homogeneous watershed, whereby the lumped parameter approach is used, or to a nonhomogeneous watershed using sediment routing procedures. For the lumped parameter method, the K, LS, and CP values are area weighted averages over the watershed. Peak discharge and runoff volume are the total values for the watershed and are generated from a HEC-1 model. In the sediment routing procedure, the sediment yield is calculated for each subbasin. A routing coefficient is then applied to the sediment yield produced from each subbasin to account for the size and quantity of sediment

exiting the subbasin and reaching the watershed exit, or detention basin. The sediment yield total for the watershed is then the summation of the routed subbasin yields.

Sediment Delivery Ratio

To convert the gross sediment loads calculated with the USLE method, a ratio of sediment yield to gross sediment production, or sediment delivery ratio, is required. Evaluations of a sediment delivery ratio (SDR) are typically determined from reservoir sedimentation surveys or direct measurements. In the absence of actual measurements, a range of sediment delivery ratios was developed from a relationship presented in Reference 8. The SDR values for the 34.56 sq mi Upper Flamingo watershed is 4 to 29 percent.

U.S. ARMY CORPS OF ENGINEERS' METHODS

In their 1991 report, the U.S. Army Corps of Engineers (COE) discussed several procedures for developing the sediment yield for average annual and 100-year, 6-hour storm events (Ref. 7). The first several sections of the COE report compare different methods for obtaining sediment yields. The COE then establishes a sediment yield/square mile "rule of thumb" for alluvial fans using the USLE and MUSLE methods. The COE findings are discussed below.

COE Comparisons

The COE compared the results calculated with the "Los Angeles District Debris Estimation Method" (Method) to five watersheds having geographic similarities to the Upper Flamingo watershed, and which had had their sediment yield measured or estimated. The latter watersheds were some of the watersheds used to produce the Las Vegas Regional Curve which shows sediment yield plotted against drainage area (Reference 2). When plotted on the same curve, the sediment yield from the Method watersheds was about 5.6 times greater than the study watersheds. The COE concluded that watersheds in this geographic area yield 18 percent of the sediment generated by the Method for average annual sediment amounts.

The COE then compared values for average annual and 100-year sediment yields calculated using the Method to determine a ratio between the two yields. They estimated that the 100-year sediment yield is 15 times greater than the average annual sediment yield. The average annual

yields derived using this ratio compared well to the Las Vegas Regional Curve, and the COE adopted these values for the watersheds examined in their report.

Additional data obtained from the USDA Agricultural Service for reservoirs in the same physiographic/climatic region as Las Vegas, were plotted on the Las Vegas Regional Curve. These plots were consistently below the curve, so the COE determined that the curve reflects a maximum value for average annual sediment yield rather than a minimum value as suggested in Reference 2.

The final comparison made by the COE to substantiate their adopted values was to the "Pacific Southwest Area Interagency Committee (PSIAC) Method. Their findings suggested that the values obtained using the 15:1 ratio were comparable.

COE "Unit" Sediment Yields

Using the same USLE and MUSLE equations discussed earlier in this report, the COE attempted to establish the average annual and event-based sediment yields on an alluvial fan. The following values were used for the factors on a representative 1 square mile watershed:

Parameter	USLE	MUSLE
R	27	N/A
K	.15	.15
LS	0.5928	0.5928
CP	.95	.95
Q	N/A	1130 cfs
V	N/A	87 ac-ft

The peak discharge was obtained from a table and the runoff volume was pulled from a HEC-1 model on a similar watershed with a 1 square mile area. The R and K factors are similar to those defined for the Upper Flamingo watershed in the previous section, however, the CP value of .95 is more than double the values reported in the SCS table. The CP value used by the COE is in the range reported for disturbed, i.e., bulldozed, fields, which does not represent the desert topography found throughout this region.

Using the above factors, the COE estimated the average annual sediment yield to be 0.67 ac-ft/sq mi/yr. Using a more representative, yet conservative, CP factor of 0.45 for no canopy or ground cover, the adjusted "unit" average annual sediment yield would be 0.32 ac-ft/sq mi/yr. The COE 100-year flood "unit" sediment yield is 2.30 ac-ft, which becomes 1.09 ac-ft with a more realistic CP factor.

DISCUSSION OF RESULTS

This section will compare and discuss the results of the different methods used to estimate the average annual and storm specific, or 100-year, 6-hour storm, sediment yields.

Average Annual Sediment Yield

The COE used the "unit" average annual sediment yield figure of 0.67 ac-ft/sq mi/yr to estimate the Upper Flamingo sediment yield at 24.1 ac-ft/yr. Using the adjusted "unit" value, the estimate for the average annual sediment yield would be 11.1 ac-ft/yr.

Using the Las Vegas Regional Curve, which the COE proposed to be a maximum value based on their plots of measured sediment yield/drainage area for geographically similar watersheds, the average annual sediment yield from the 34.56 sq mi Upper Flamingo watershed is 13.13 ac-ft/yr.

The USLE calculations performed by Black & Veatch for this task yield gross average annual sediment loads of between 55.3 and 117.5 ac-ft/yr. Applying the median SDR value of 16 percent, the average annual range is 8.85 to 18.8 ac-ft/yr. The value obtained from the Las Vegas Regional Curve falls in the middle of this range.

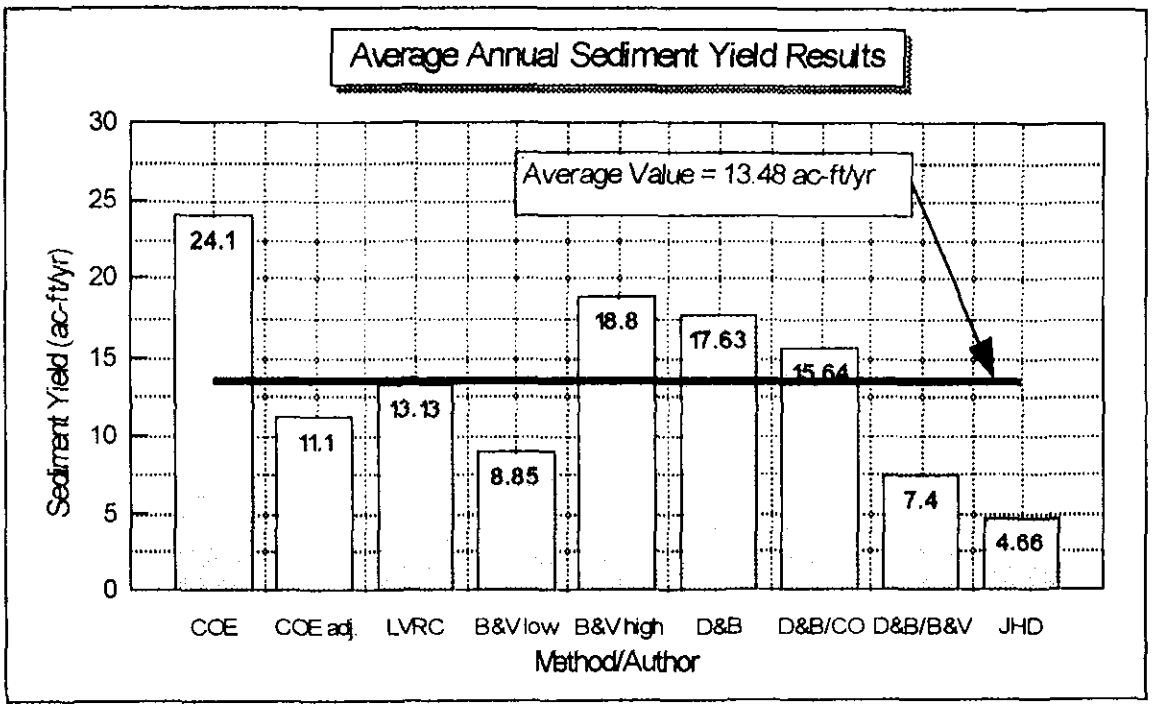
A statistical analysis method was also used to corroborate the sediment yield values obtained thus far for the Upper Flamingo watershed area. For drainage areas between 1 and 30,000 sq mi, the following relation was established by Dendy and Bolton:

$$\frac{S}{S_R} = \left(\frac{A}{A_R}\right)^{-0.16} \qquad \text{(Ref. 6)}$$

Where, S = Sediment yield (tons/sq mi/yr),
S_R = Reference sediment yield for 1 sq mi = 1645 tons/yr,
A = Drainage area (sq mi), and
A_R = Reference drainage area = 1 sq mi

Applying the above relation to the Upper Flamingo watershed and using the reference values, the sediment yield generated is 17.63 ac-ft/yr. Using the COE "unit" value for sediment load produced per 1 sq mi, the yield is 15.64 ac-ft/yr. Adjusting further to correct for the high CP value used by the COE, the sediment yield becomes 7.4 ac-ft/yr.

Another method obtained from the *Journal of Hydraulics Division*, ASCE, was published as being specific to the western United States (Ref. 4). The method predicted the average annual sediment yield by using climate (average precipitation and temperature values), watershed slope, and soil characteristics as independent variables in the following equation:



$$\log (Y + 100) = 6.21301 - 2.19113 \log(X_1 + 100) + 0.06034 \log(X_2 + 100) - 0.01644 \log(X_3 + 100) + 0.04250 \log(X_4 + 100)$$

Where, Y = Sediment Yield (ac-ft/sq mi/yr),
X_1 = Avg. precipitation / avg. temperature ratio (in/°F),
X_2 = Weighted watershed average (%),
X_3 = Soil particles > 1mm (%), and
X_4 = Soil particles < 2μm (%).

In addition to the percentage of particles smaller than 2μm, the X_4 value can be positive or negative depending on the pH of the soil. For pH values greater than 7.0, as for the Upper Flamingo watershed soils, the sign is positive; for acidic soils, the sign is negative. The average

annual sediment yield produced by the above equation is 4.66 ac-ft/yr. This value falls below the range developed from the Las Vegas Regional Curve.

In summary, average annual sediment yields calculated using values specific to this geographic region were lower than the yields generated using general approaches. The following graph depicts the range of values suggested for the average annual sediment yield for the Upper Flamingo watershed. The average annual sediment yield suggested for use in this study is 13.48 ac-ft/yr.

Storm Specific Sediment Yield

For the 100-year event, the COE took the average annual estimates for the small watersheds studied in their report, and applied the 15:1 ratio. These small watersheds accounted for 12.43 sq mi of the Upper Flamingo watershed. For the remainder of the watershed, 25.86 sq mi according to the COE report, sediment yield from sheet and rill erosion, gully erosion, channel

degradation, and bank erosion were calculated and added to the previous total. The COE also added sediment yield from the Red Rock Detention Basin based on a trap efficiency of 91 percent. The total sediment yield from the Upper Flamingo watershed is 153 ac-ft for the 100-year event. Using a trap efficiency of 90 percent for the UFWDB, the sediment remaining in the detention basin becomes 138 ac-ft.

Using the adjusted COE's "unit" sediment yield of 1.09 ac-ft/sq mi, the total sediment yield for the Upper Flamingo watershed would be 37.7 ac-ft. Adding to this the 78.2 ac-ft generated by gully, channel, and bank erosion, (adjusted for area), the total sediment yield into the UFWDB becomes 115.9 ac-ft. Applying the 90 percent trap efficiency value, the sediment load remaining in the basin is 104.3 ac-ft for the 100-year event.

The MUSLE lumped parameter method assumes a homogeneous watershed which is not characteristic of the Upper Flamingo watershed. The sediment yield obtained using this method produced an unrealistic value of 236 ac-ft over the watershed. Since the watershed is heterogeneous, the lumped parameter solution was eliminated from consideration.

The MUSLE routing procedure produced a 100-year sediment load of 116 ac-ft which would equate to 104.4 ac-ft of sediment remaining in the basin. This value is the same as that derived using the COE's information.

The following table summarizes the sediment yields estimated for the 100-year, 6-hour event.

Method / Author	Sediment Yield 100-year Storm (ac-ft)
COE	138
COE adjusted	104.3
MUSLE - Routing Method	104.4

For analysis of the impact on the UFWDB, a value of 105 ac-ft will be used for the 100-year event sediment loading.

CONCLUSION

The various methods used to estimate the average annual and storm event sediment loading on the Upper Flamingo Wash Detention Basin have produced results which differ by as much as five magnitudes. Watersheds which have had their sediment yield measured or estimated, and which have geographic similarities to the UFWDB, were considered to provide a better indication of the sediment yield expected to occur from the Flamingo watershed rather than the general analytical approaches. The average annual sediment yield estimated for the UFWDB is 13.48 acre-feet. The 100-year sediment loading is estimated to be 105 acre-feet. This value will be used to adjust the storage capacity of the UFWDB for the new Base Flood Event which will be evaluated in the following section, UFWDB PERFORMANCE ANALYSIS.

UFWDB PERFORMANCE ANALYSIS

SCOPE

The performance of the UFWDB was analyzed for the new Base Flood Event after adjusting for the sediment loading and the increased storage capacity provided by the mining operation occurring within the impoundment area. The HEC-1 computer model was modified from the one presented in the BASE HYDROLOGY Section to account for the change in basin capacity. The results are provided in this section.

INCREASED STORAGE

Following completion of the UFWDB in 1992, the Bureau of Land Management (BLM) granted a 3-year mining permit to Hollywood Gravel to excavate and remove aggregate from the UFWDB impoundment area. According to Hollywood Gravel, approximately 334,000 cubic yards (cy) of material had been removed from the impoundment area by April 1995. They estimated that between 450,000 to 500,000 cy of material would be removed by the end of 1995, when their mining permit expires. Hollywood Gravel indicated that they may request a 6-month extension of the mining permit.

To evaluate the progress of the mining operation, Black & Veatch obtained the grading plans from the CCRFCD. Based on conversations with Hollywood Gravel, review of the grading plans, and field reconnaissance, excavation is taking place between the elevations of 2460 and 2480. Using Hollywood Gravel's estimate that 450,000 cy will be removed from the impoundment area by the end of 1995, the mining operation will provide approximately 280 acre-feet of additional storage capacity in the basin. However, only the material excavated below the spillway elevation of 2470.5 feet will benefit detention basin storage for the base flood event.

The impact of the mining operation on the UFWDB storage capacity was determined graphically from the stage-storage curves shown in the figure titled "UFWDB Stage - Storage Curves" at the end of this section. The original curve was plotted using the basin parameters representative of the existing facility. Beginning at elevation 2460, the original curve was "stretched" and extended an additional 280 acre-feet at elevation 2480 to become the extended curve. New

storage capacities were obtained from the extended curve. Next, the sediment load for the new Base Flood Event (105 acre-feet) was subtracted from the extended curve volumes and a third curve, the revised curve, was plotted. The revised curve volumes were entered into the HEC-1 computer model defined in the BASE HYDROLOGY Section to evaluate the performance of the UFWDB after accounting for the mining operation and sediment loading.

PERFORMANCE RESULTS

By adjusting the existing stage-storage curve between the elevations of 2460 and 2470.5, the UFWDB's storage capacity increased approximately 150 acre-feet. However, most of the increased capacity was offset by the 105 acre-feet required for sediment storage. The remaining 45 acre-feet serves to lower the 100-year pool elevation thereby reducing the spillway overtopping head from elevation 2471.15, as modeled previously, to elevation 2471.00. The results of the revised HEC-1 model are listed below. These values were used for all subsequent analyses.

Peak Inflow	6660 cfs	Peak Spillway Discharge	1287 cfs
Peak Outflow	2579 cfs	Peak Reservoir Stage	2471 ft
Peak Orifice Discharge	1292 cfs	Peak Storage	1095 ac-ft

CONCLUSIONS

The peak inflow of 6660 cfs into the UFWDB includes 5429 cfs routed from the Red Rock Detention Basin spillway and outfall. The UFWDB peak inflow also includes runoff from subbasins downstream of the Red Rock Detention Basin in addition to the 15.9-square mile Upper Flamingo Wash watershed. This revised routing from the Red Rock Detention Basin and downstream subbasins produces a peak inflow which represents a worst-case scenario for the UFWDB. Although the UFWDB operational parameters account for the BLM mining operation and sediment loading, these worst-case conditions produce a 100-year pool elevation which exceeds the spillway elevation of 2470.5 feet with depths ranging from 0 to 0.5 feet. The maximum stage of 2471.0 feet is maintained for approximately 35 minutes; the spillway head exceeds two inches for a period of 2.25 hours. During the approximately 5.5 hours that the stage is above 2470.5 feet, approximately 17.8 acre feet of water surpasses the capacity of the spillway.

EMBANKMENT AND SPILLWAY STABILITY

SCOPE

This section evaluates the stability of the UFWDB embankment and spillway during the new Base Flood Event. The evaluation is based on review of the original design parameters and comparison of the original design conditions with the conditions produced for the new Base Flood Event.

SITE DESCRIPTION AND GEOLOGY

The Upper Flamingo Wash Detention Basin was constructed on undeveloped desert topography dominated by Flamingo Wash. Surficial sand deposits were present over a majority of the site with some areas of gravels and cobbles exposed in the wash bottoms. The ground surface was sparsely vegetated, with somewhat heavier vegetation present near the wash. Site elevations generally decrease from southwest to northeast.

During the original design phase of the project, an extensive geotechnical exploration was conducted by Kleinfelder, Inc. to investigate the geologic conditions of the site and determine appropriate material properties for design. The geotechnical programs included a literature review of previously published studies and reports for this area of the Las Vegas Valley, field investigations, and preliminary and final design reports. The field investigation program consisted of 31 soil borings ranging in depth from 10 to 70 feet, and 29 backhoe excavated test pits ranging in depth from 0.5 to 14 feet. (The shallow test pits resulted from backhoe refusal on cemented material.) Soil samples obtained from the borings and test pits were used in laboratory analyses to determine both insitu and remolded soil properties. The Project Geotechnical Report was prepared to document the findings of the geotechnical exploration program. A copy of this report is provided in Volume 2 of this submittal.

EMBANKMENT REVIEW

This section summarizes the basis of design for the UFWDB embankment structure and addresses the issue of embankment stability for the new Base Flood Event.

Embankment Geometry

The UFWDB embankment is a 4813-foot long, homogeneous-fill earthen embankment with a downstream foundation blanket drain. The embankment height varies from 0 to 38 feet. The upstream slope is 3:1 (H:V). The downstream slope changes from 2:1 at the toe to a variable slope in the middle section, and then to a slope of 2.5:1 for the upper portion of the embankment.

Materials of Construction

The UFWDB embankment is constructed of job excavated materials obtained from within the detention basin impoundment (reservoir) area. As indicated in the Project Geotechnical Report, the onsite materials consisted primarily of alluvial sands and gravels with USCS classifications SM, SP, SW, GM, GP, GW, and dual classified materials. The insitu soils in the southern portion of the site ranged from moderately to heavily cemented materials. Shallow depth, low impact blasting was necessary to free materials for excavation and processing. Blasting was not permitted within 200 feet of the upstream toe of the embankment.

Excavated materials were processed using screening operations to remove oversized cobbles, boulders, and cemented gravel conglomerates from the embankment fill material. A maximum stone size of 6 inches was specified in the construction specifications. Oversized materials were processed to produce riprap for the upstream embankment slope face, downstream toe drain, and graded gravel for the foundation blanket drain.

Discussion of Analysis & Design Methods

A summary of the analysis and basis of design for the UFWDB embankment is provided below. Analysis calculations and documentation are included in Volume 3 of this submittal.

Slope Stability. A slope stability analysis of the UFWDB embankment structure was prepared using the XSTABL computer program. Modes of slope failure investigated included modified Bishop methods for circular failures, and simplified Jambu methods for irregular failure surfaces and block failure modes. Minimum factors of safety used for design are in accordance with the recommendations published in "Earth Dams and Reservoirs", Soil Conservation Service, TR-60, 1981.

For the analysis, a range of material weights and soil strength parameters were considered to evaluate the sensitivity of variation in material properties. The range of values used are listed below.

Property	Embankment	Foundation
Moist unit weight γm	126 pcf	105 pcf
Saturated unit weight γs	135 pcf	115 pcf
Cohesion c	0 psf	0 psf
Internal friction angle ϕ	32° to 36°	29° to 36°

Upstream Slope. The stability of the upstream slope was evaluated for end of construction, seismic, and rapid reservoir drawdown conditions. The analysis was based on a typical maximum embankment section with a height of 38 feet. Minimum factors of safety published in TR-60 are as follows:

Condition	Minimum Safety Factor
End of Construction	1.3
Seismic Event	1.1
Rapid Drawdown	1.2

The end of construction, seismic, and rapid drawdown conditions were analyzed according to the following case descriptions:

Case 1. For the end of construction case, a saturation surface was assumed because of the build up of pore pressures resulting from drainage of construction waters. This case reflects a very conservative analysis due to the granular nature of the embankment materials. Factors of safety for this case ranged from 1.31 to 1.60.

Case 2. Seismic analysis of the upstream slope was based on a saturated soil condition and a horizontal acceleration of 0.1g. Factors of safety for this case ranged from 1.42 to 2.56.

Case 3A. The reservoir stage rapidly drops from the PMF pool elevation of 2478.4 to an empty basin. Although this situation does not reflect a realistic operating scenario, it provides a very conservative analysis of the overall stability of the upstream slope, since the slope is completely saturated when the basin is empty. Factors of safety for this case ranged from 1.53 to 1.95.

Case 3B. The reservoir stage rapidly drops from the PMF pool elevation of 2478.4 to the spillway crest elevation of 2470.5. This situation reflects a conservative but more realistic analysis of the upstream slope stability under detention basin operation for a PMF event. Factors of safety for this case ranged from 1.62 to 2.65.

Case 3C. The reservoir stage rapidly drops from the PMF elevation of 2478.4 to an elevation of 2460. This situation reflects continued detention basin operation beyond the period of spillway overtopping. Factors of safety for this case ranged from 1.55 to 1.84.

Downstream Slope. The stability of the downstream slope was evaluated for end of construction, seismic, and transient seepage conditions. The analysis was based on a typical maximum embankment section with a height of 38 feet. Minimum factors of safety published in TR-60 are as follows:

Condition	Minimum Safety Factor
End of Construction	1.3
Seismic Event	1.1
Seepage	1.5

The end of construction, seismic, and seepage conditions were analyzed according to the following case descriptions:

Case 1. For the end of construction case, a saturation surface was assumed because of the build up of pore pressures resulting from drainage of construction waters. This case reflects a very conservative analysis due to the granular nature of the embankment materials. Factors of safety for this case ranged from 1.72 to 2.45.

Case 2. Seismic analysis of the upstream slope was based on a moist soil condition and a horizontal acceleration of 0.1g. Factors of safety for this case ranged from 1.25 to 3.15.

Case 3. To evaluate the effects of seepage on the downstream slope, a phreatic surface was established based on a transient flow net evaluation. Factors of safety for this case ranged from 1.62 to 2.49.

SPILLWAY REVIEW

This section summarizes the structural basis of design for the UFWDB spillway structure and addresses the issue of spillway stability for the new Base Flood Event.

Spillway Geometry

The UFWDB spillway structure is a labyrinth-type spillway which consists of the following two principal structural elements:

- A four cycle, 25-ft vertical cantilever, labyrinth weir wall on a mat foundation.
- Variable height spillway abutment walls designed and constructed as counterfort retaining walls on continuous footings.

The spillway was originally designed as a three-cycle labyrinth by Black & Veatch in May 1989. Following delays associated with desert tortoise mitigation, project funding, and subsequent revision in the methods of computing the PMF, a fourth cycle was added in September 1990. The addition of a fourth labyrinth cycle did not impact the analysis or design of the structure. The structural design is based primarily on analysis of strip wall sections and plate theory which is common practice in the design of structural walls.

Materials of Design

The labyrinth spillway weir wall, foundation, and counterfort abutment walls were designed to be constructed of reinforced concrete with the following properties:

Concrete compressive strength	f'c = 4000 psi
Reinforcing steel yield strength	fy = 60,000 psi

Concrete design was completed using ultimate strength methodology using the above values and appropriate load factors.

Discussion of Analysis & Design Methods

A summary of the basis of design for the labyrinth spillway section and the spillway abutment walls is provided below. Design calculations for the two structures are included in Volume 3 of this submittal.

Labyrinth Spillway & Foundation Slab. The labyrinth weir wall section consists of 25-foot tapered vertical cantilever walls. The thickness of the wall varies from 2.13 feet at the base to 12 inches at the top. The wall is rigidly attached to a 3-foot thick base slab.

The labyrinth wall section was analyzed by conventional means assuming a fixed based, free top model. The resulting wall base shear and moment values were used as input in the analysis of the base slab. The base slab was assumed to behave as a mat foundation. However, for analytical simplicity, the base slab was modeled by computer methods as a series of strip beams on elastic foundations. The modulus of subgrade reaction (Ks = 200 pcf) used in the analysis was based on literature review and information contained in the Project Geotechnical Report. Multiple strips were analyzed to determine the resulting slab shears and the distribution of moments in the upper and lower portions of the slab at various plan locations.

The controlling case for the labyrinth wall and base slab design was based on a hydrostatic loading equal to 34 feet of static water pressure applied to the upstream face of the labyrinth wall. This loading condition represents a spillway operating head of nine feet as shown in the

figure titled "Hydrostatic Design Loading - Labyrinth Spillway Weir Wall" at the end of this section. The effect of backwater forces acting on the downstream face of the labyrinth wall to counteract the driving head forces was conservatively neglected.

Spillway Abutment Walls. The abutment walls at each end of the spillway section consist of sloping counterfort retaining walls. The wall height varies from 35.25 feet at the center portion of the embankment dam to 5.44 feet and 2 feet at the upstream and downstream toes, respectively.

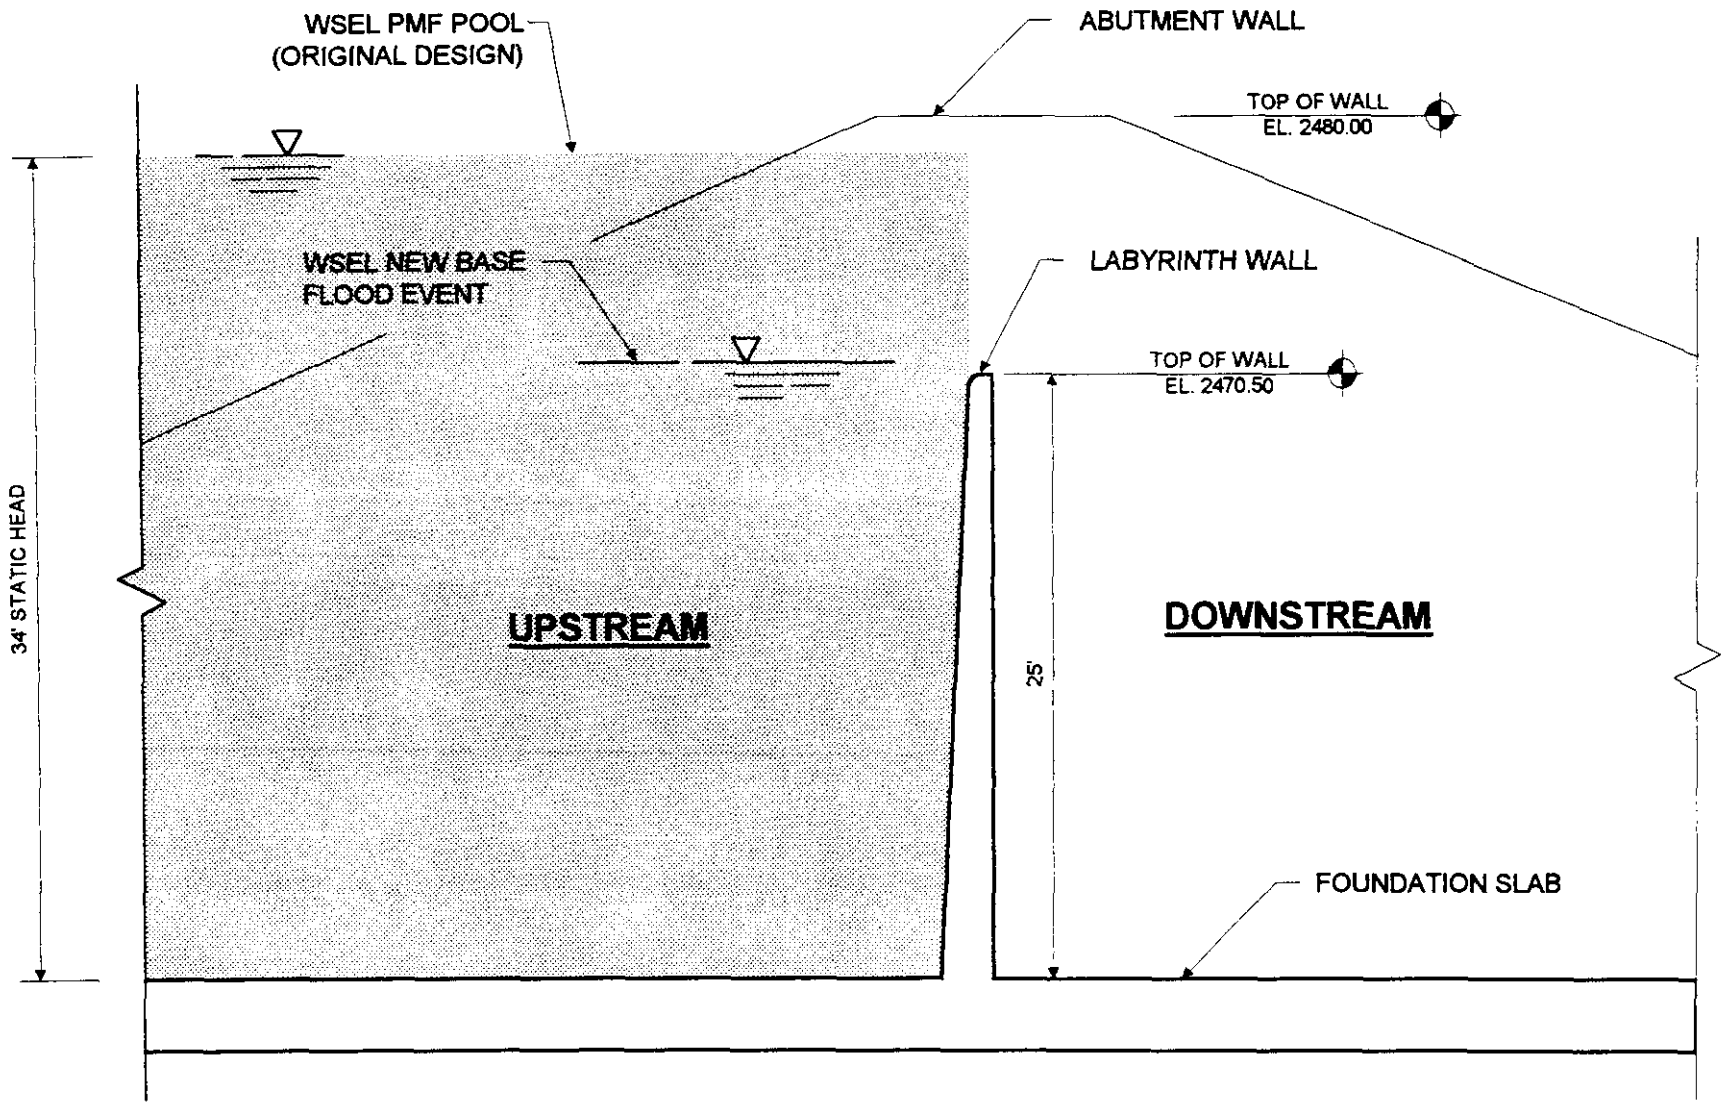
The stability of the walls were analyzed for various loading cases using conventional methods. Based on consultation with Kleinfelder Inc. and the Project Geotechnical Report, design of the wall footings was based on an allowable soil bearing pressure of 8,000 psf. This bearing pressure was established to limit total footing settlement to approximately 0.75 to 1 inch, and differential settlement to 0.5 inch. The coefficient of soil friction against wall sliding used in the analysis was 0.58. The following four loading cases were analyzed:

- Construction Condition - basin empty, surcharge loading of 400 psf to account for compaction of soil behind wall.
- 100-year Flood - detention basin water surface elevation at 2470.5, no backwater acting on downstream portion of wall, embankment (backfill) saturated.
- PMF Event - detention basin water surface elevation at 2478.4, backwater elevation 2456.0, embankment (backfill) saturated.
- Post PMF Event - detention basin drained, embankment (backfill) saturated.

Various height wall sections were considered to establish corresponding footing widths and check factors of safety against overturning and sliding. The factor of safety against overturning for the various wall sections ranged from 2.5 to 5.2, with the Post PMF Event typically producing the

controlling conditions. The factor of safety against sliding for the various wall sections ranged from 1.5 to 2.1. Again, the Post PMF Event typically produced the lowest factors of safety.

Once proportioned for stability, wall panel and counterfort design was based on conventional methods of analysis and the United States Bureau of Reclamation publication entitled "Moments and Reactions for Rectangular Plates," (1974).



QUALITY ASSURANCE / QUALITY CONTROL

Quality assurance of the design requirements for the embankment and spillway was safeguarded during construction by a full time Black & Veatch resident engineer and the Owner's independent testing consultant. A summary of the construction testing results is provided in Volume 2 of this submittal.

CONCLUSION OF STABILITY ANALYSIS

The UFWDB embankment and spillway structures were originally designed for short term reservoir operation at elevation 2478.4 feet. In review of the work presented in the BASE HYDROLOGY and UFWDB PERFORMANCE ANALYSIS Sections of this report, the new Base Flood Event will produce a maximum reservoir surface elevation of 2471.0 feet. As a result, the hydrostatic and hydraulic forces acting on the UFWDB embankment and spillway structure due to the new Base Flood Event will be less than the forces used in the original design of the facility. Based on these findings, review of the original design calculations, and review of the construction testing records, we find the UFWDB embankment and spillway structure to be suitable and stable for loading conditions in excess of those produced by the new Base Flood Event.

Hydrostatic Design Loading - Labyrinth Spillway Weir Wall

Clark County Regional Flood Control District
Upper Flamingo Wash Detention Basin

DISCHARGE CHANNEL ANALYSIS

SCOPE

Black & Veatch analyzed the existing UFWDB discharge channel by inputting the new Base Flood Event from the HEC-1 model developed in the UFWDB PERFORMANCE ANALYSIS section into the U.S. Army Corps of Engineers' HEC-2 Water Surface Profiles computer program. The new Base Flood Event peak discharge is 2579 cfs. The HEC-2 output was evaluated to determine the water surface profile in the discharge channel and the aerial extent of the 100-year flood plain. The output was also compared to the results obtained from calculations using Manning's Equation.

UFWDB OUTFALL DESCRIPTION

A 7-foot by 8-foot orifice is constructed in the center cycle of the four-cycle labyrinth spillway. The orifice discharge is contained by the walls of the 100-foot deep labyrinth until it emerges into a 52-foot wide energy dissipating "chute" in the center of the apron. The chute contains 2-foot high baffle blocks down the 3H : 1V slope. Over the next 55.3 feet of apron length, the chute bottom width transitions from 52 feet wide to 20 feet wide to match the discharge channel bottom width. Water on other portions of the 272-foot wide apron can flow into this transitional approach to the discharge channel. A 10-foot wide layer of 18-inch riprap abuts the downstream end of the apron. The spillway and apron are shown in plan on Sheet 11 and in section on Sheet 12 of the As-Built Construction Drawings.

The UFWDB discharge channel is approximately 2900 feet long beginning at Station 1+46.44 at the spillway apron edge. The channel ends at the Hacienda Avenue box culvert at Station 30+43.62. The trapezoidal channel has a 20-foot bottom width and 2H : 1V side slopes. A 6-foot wide concrete low-flow channel is constructed down the center of the channel to handle nuisance flows. The rest of the channel is lined with gabion mattresses. A 10-foot wide access road constructed with 4 inches of Type II aggregate base material is located on the right, or south, channel bank. The discharge channel plan and profile are shown on Sheets 17 through 19 of the As-Built Construction Drawings.

The channel alignment is generally from the southwest to the northeast. Three curves make horizontal changes in direction: two gradual curves at Stations 2+32.32 and 14+03.09, and a sharp curve at Station 29+00.44. At Station 6+65.00, a 1.77-foot gabion drop structure makes up a grade differential between the existing topography and the channel flowline. The channel has three reaches which are characterized by a change in the bottom slope and gabion lining height. The following table lists the reach characteristics:

CHANNEL REACH CHARACTERISTICS			
STATIONS	1+46.44 to 6+65.00	6+65.00 to 28+00.00	28+00.00 to 30+43.62
Slope (%)	0.30	1.06	0.15
Lining Height (ft)	7' - 4"	6' - 0"	8' - 6"
Capacity (cfs)	2458	3135	2327

Channel flow capacities were initially calculated to the top
Equation. A Manning's "n" value of 0.024 was used to rep
low-flow channel and gabion lining. Based on the channe
cfs, the critical depth for the channel is 6.43 feet. Oth
tabulated below.

CALCULATED CHANNEL REACH CHARACTER			
STATIONS	1+46.44 to 6+65.00	6+65.00	
Flow Regime	*subcritical*	sup	
Froude Number	.75	1.36	.54
Velocity (fps)	9.80	15.46	7.61

The discharge channel was originally designed to convey 1225 cfs with an available freeboard of approximately two feet. The limiting reach of channel is between Stations 28+00.00 and 30+43.62 where the slope is reduced to 0.15 percent. Using Manning's Equation, the approximate channel capacity without freeboard, or to the top of the gabion lining, is 2327 cfs in this reach.

CHANNEL OVERBANK DESCRIPTIONS

For approximately 100 feet downstream of the apron, the left, or north, overbank area slopes toward the discharge channel. From approximate Stations 3+00 to 22+00, the left overbank area is typically one to three feet lower than the channel bank and Hacienda Avenue. Water which enters the left overbank between these stations remains in the low area bounded by the channel bank and Hacienda Avenue and is not able to reenter the channel. Along the next 600 feet of channel length, the left overbank is elevated between the channel and Hacienda Avenue. Beginning at Station 28+00 and to the end of the channel, the left overbank grade diminishes along with the grade of Hacienda Avenue such that, at the box culvert, the grades are equal to the channel bank. Photos 1 through 4 at the end of this section illustrate the left overbank topography.

The right overbank slopes away from the channel along most of the channel length. Water entering the right overbank upstream of Station 4+00 will flow toward a depressed area approximately 150 feet south of the channel. Between Stations 4+00 and 24+00, the right overbank is defined by a 12-foot high concrete block wall and a vacant lot with grades up to seven feet higher than the channel bank. Water which enters the right overbank along this reach will drain into short, minor gullies. The gullies parallel the discharge channel and then reenter the channel through culverts installed in the channel bank at Stations 17+62.00, 18+02.00, and 24+57.00. The right overbank reduces in elevation after Station 24+00, however, superelevation of the right channel bank begins at Station 23+12.25 and appears to be sufficient to prevent water from overtopping the right channel bank downstream of that station. Photos 5 through 9 at the end of this section illustrate the right overbank topography.

PEAK DISCHARGE IMPACT ON THE SPILLWAY AND APRON

Based on the outflow hydrograph for the new Base Flood Event, water overtops the spillway up to a depth of 0.5 feet during the 100-year storm event. This equates to a flowrate of approximately 1300 cfs overtopping the spillway during the 5 to 10 minutes the UFWDB is at peak stage. It is estimated that water overflowing the two inside spillway cycles will be collected in the discharge channel. However, the overflow from the two outside labyrinth cycles will most likely overcome the mild transverse apron slope toward the channel and flow off the end of the apron into the channel's overbank areas. This assumption yields a maximum of 325 cfs of water flowing off the apron into each overbank area.

Because of the slope of the left overbank toward the channel, it is assumed that water entering the left overbank area will flow into the discharge channel within 100 feet downstream of the apron. Water entering the right overbank will flow south approximately 150 feet and pond in a low area bounded by the UFWDB embankment on the west, approximately 12 feet of fill on the south, and a 12-foot concrete block wall on the east. The ponding area is shown in Photo 10 at the end of this section. Once the pond depth reaches approximately one foot, the water will flow along the concrete block wall and flow parallel to the channel entering the minor gullies discussed earlier. The ponding water will dissipate via infiltration or evaporation.

WATER SURFACE PROFILE MODEL

To evaluate the performance of the UFWDB discharge channel and delineate the floodplain, the water surface profile was determined using the U.S. Army Corps of Engineers' HEC-2 computer program. Although the overbanks may convey some of the water overtopping the spillway, the discharge channel was conservatively analyzed using the total peak discharge of 2579 cfs. As stated earlier, the calculated maximum capacity of the discharge channel is 2327 cfs. Based on the HEC-1 output from the UFWDB PERFORMANCE ANALYSIS Section, this channel capacity is exceeded for a period of approximately 50 minutes. During this time frame, approximately 252 cfs of water cannot be contained in the discharge channel.

The discharge channel geometry was obtained from the As-Built construction drawings. A survey was performed to update the overbank topography since construction of the UFWDB project.

HEC-2 computer models were developed to calculate the water surface elevation by first using the flow area available within the limits of the channel by implementing the X3 card in the program. If the calculated water surface elevation exceeded one of the channel banks, the available overbank area was included. Other HEC-2 models were prepared which provided only the channel cross-section data, omitting the overbank information. In these models, if the water surface exceeded the channel banks, the program projected vertical extensions at the banks to calculate the additional depth required. The HEC-2 file names are included below for ease of discussion.

RCHSUB - Subcritical run with overbank information.
RCHSUP - Supercritical run with overbank information.
ROWSUB - Subcritical run without overbank information.
ROWSUP - Supercritical run without overbank information.

The following sections describe the HEC-2 Water Surface Profile results. Comparisons are made to the initial calculations performed using Manning's Equation. Cross sections of the channel and overbanks are provided at the end of this section. The water surface elevation shown in the cross section is taken from the combined HEC-2 results as described below.

Station 1+46.44 to Station 6+65.00

Using Manning's Equation, this reach has a maximum capacity of 2458 cfs to the top of the 7'-4" high lining. Based on the outflow hydrograph, this channel capacity is exceeded for approximately 30 minutes. During this time, approximately 121 cfs of water would top the channel banks if the peak discharge (2579 cfs) entered the channel. The first 500 feet of the discharge channel was calculated as a subcritical reach with a normal depth of 7.52 feet, which is approximately 2.2 inches above the channel lining.

Although this reach was determined to flow subcritical, the 1.77-foot drop at Station 6+65 and subsequent change to supercritical flow appear to create a drawdown effect so that the reach flows lower than calculated. When analyzed in the subcritical run RCHSUB, the program defaulted to "critical depth assumed" at all stations except Station 1+46. The HEC-2 program

is unable to calculate flow depths below critical depth under subcritical conditions, therefore, the flow was determined to be at or below critical depth in model RCHSUB. Although the water surface profile was calculated using critical depth, the model indicated that as much as 1327 cfs (more than half of the peak discharge) entered the left overbank area at Station 6+00. The flow depth at Station 6+00 was 7.36 feet.

When the reach was analyzed in model ROWSUB, critical depth was assumed only at Station 6+65, which corresponds with the location of the drop structure where critical depth is expected. The height of the vertical extensions at the channel banks required by the upstream stations varied from between 0.78 feet at Station 6+00 to 1.01 feet at Station 2+00. The average vertical extension, or depth of flow over the channel banks, was 0.92 feet. To determine the area of flow over the channel banks, the average flow depth was multiplied by the average distance (86.5 feet) between the stations. The average channel velocity in this reach was 10.3 fps, but the flow velocity over the banks should be much less than the velocity in the channel. The average overbank flow velocity calculated in model RCHSUB was 2.2 fps. Thus, the flowrate over the channel banks was estimated by multiplying the average flow area by 2.2 fps, which yields 175 cfs.

When modeled in the supercritical run RCHSUP, all of the stations except Station 2+00 had flow depths below critical depth. The HEC-2 program defaulted to critical depth at Station 2+00 indicating that the flow depth was higher than the program could calculate. The overbank flowrates and channel flow depths calculated in model RCHSUP more closely resembled the values predicted using Manning's Equation and the flow area method described above. Overbank flow occurred at the two upstream stations where a maximum of 154.4 cfs entered the left overbank and 184.6 cfs entered the right overbank. This occurred at Station 2+00 where the flow depth over the channel banks was 1.16 feet, slightly higher than the average depth determined in model ROWSUB. (This depth would yield 220 cfs in the overbanks using the flow area method.) The average flow depth in the channel was 7.6 feet, or approximately three inches over the channel lining height and within one inch of the normal depth predicted with Manning's Equation.

Critical depth was assumed for all stations in model ROWSUP. Although the actual flow depth may be higher than the depth used in the model, the flow remained in the channel and vertical extensions were not required.

Based on the various models, this reach can be expected to contribute up to 220 cfs of water into the overbank areas providing 2579 cfs enters the channel. Water entering the right overbank will be stopped by a concrete block wall. Water will flow east along the wall until it enters a minor gully, which will eventually daylight into the UFWDB discharge channel. Water overflowing the left channel bank downstream of Station 2+00 will be contained by a defined wash in the outer left overbank area. The wash becomes less defined downstream but this overflow will remain in the left overbank area. Upstream of Station 2+00, left overbank flow will reenter the discharge channel.

The water surface profile provided at the end of this section was produced with the output from the supercritical model RCHSUP between Stations 1+46.44 and 6+65.00.

Station 6+65.00 to Station 28+00.00

The reach of channel between Stations 6+65.00 and 28+00.00 flows supercritical and, using Manning's Equation, has a capacity of 3135 cfs to the top of the 6-foot high lining. The HEC-2 model RCHSUP shows that the channel is able to convey the peak discharge of 2579 cfs until Station 23+00. At this station, water enters the right overbank at a rate of 91.6 cfs. Superelevation of the right channel bank begins at Station 23+12.25 and is sufficient to prevent water from entering the right overbank downstream of that station. Water begins entering the left overbank at Station 23+00 until the end of this reach. However, the maximum rate of overflow is 8.8 cfs at Station 24+00.

Model ROWSUP indicates that vertical extensions are required to contain channel flow between Stations 8+00 to 23+00 for the right channel bank, and Stations 8+00 to 27+00 for the left channel bank. The right bank extensions range from 0.16 feet to 0.26 feet with an average height of 0.24 feet. The left bank extensions range from 0.16 feet to 0.28 feet with an average height of 0.25 feet. The average channel velocity is 15.72 fps and the average overbank flow velocity

is 1.9 fps (from model RCHSUP). The overbank flowrate is estimated to be approximately 47 cfs using the flow area method.

Although both models RCHSUP and ROWSUP calculated water surface depths for each station in this reach, the transition to subcritical depth at Station 28+00 is expected to create a backwater effect on the downstream stations of the supercritical reach. The subcritical model RCHSUB calculated flow depths above critical depth until Station 26+00. A mild (undular) or submerged hydraulic jump may occur in the supercritical reach between Stations 25+00 and 26+00.

Downstream of Station 25+00, the flow regime was assumed to be subcritical. The water surface profile for Stations 26+00 through 28+00 were obtained from model RCHSUB. The maximum overbank discharge occurred at Station 27+00 where 605 cfs entered the left overbank. The vertical extension required at the left overbank at that station was 2.56 feet.

Flow entering the left overbank area between Stations 6+65 and 28+00 will remain in the low-lying left overbank area and not reenter the channel. Flow overtopping the right channel bank upstream of Station 24+00 will reenter the discharge channel via one of the culverts which daylight in the channel. Right bank overflow did not occur downstream of Station 24+00.

The water surface profile provided at the end of this section was produced with the output from the supercritical model RCHSUP from Station 6+65 to Station 25+00, and model RCHSUB beginning at Station 26+00.

Station 28+00.00 to Station 30+43.62

This reach of channel flows subcritical. As stated earlier, the mild slope of this downstream subcritical reach limits the channel capacity to 2327 cfs. In the HEC-2 model RCHSUB, as much as 437.1 cfs tops the left channel bank at Station 29+46.50 and enters the left overbank area. Capacity is limited in the downstream left overbank area, and it is likely that this overflow will impact Hacienda Avenue which is also lower in this area. The superelevated right overbank contains the channel flow.

The height of vertical extensions required in model ROWSUB ranged from 1.31 feet to 1.36 feet with an average height of 1.34 feet. Applying the flow area method using the average overbank flow velocity (1.7 fps) computed in model RCHSUB, the average channel overflow rate is 112 cfs.

To verify that the computer program adequately accounted for superelevation as the channel alignment curved, the required freeboard was calculated. The required superelevation is calculated to be 1.02 feet following the CCRFCD Manual guidelines. The HEC-2 model indicates that at least one foot of freeboard is available on the outside of the channel curve. Therefore, adequate freeboard is available at the curve.

The water surface profile provided at the end of this section was produced with the output from the subcritical model RCHSUB between Stations 28+00 and 30+00.

FLOODPLAIN DELINEATION

The upstream limits of this study are defined by the UFWDB embankment and SVE diversion berm and channel. Washes which are intercepted by either facility have had their floodplains removed or reduced from that shown on the FIRM dated August 16, 1995. The downstream limits are the intersection of the discharge channel and Hacienda Avenue, and the thalwag of the finger wash adjacent to Buffulo Drive. The area of the floodplain removed is indicated with cross-hatching on enclosed FIRM.

The left and right overbanks are delineated on the enclosed aerial floodplain map to show the limits of the flow in those areas. The limits of the right overbank are the minor gullies parallelling the channel. The limits of the left overbank are contained by a defined wash until approximately Station 16+00, where the floodplain extends to Hacienda Avenue.

CONCLUSION

The peak discharge obtained from the UFWDB PERFORMANCE ANALYSIS hydrology is 2579 cfs. Approximately 0.5 feet of water overtops the spillway during the 5.5 hours the stage exceeds elevation 2470.5, which equates to approximately 1300 cfs. Although it is estimated that 25

percent of the overflow will flow directly into each overbank area, the discharge channel was modeled for conveying the entire 2579 cfs.

The limiting capacity of the discharge channel was calculated to be 2327 cfs in the subcritical downstream reach. This capacity is exceeded for approximately 50 minutes. The HEC-2 Water Surface Profile computer programs used to model the discharge channel indicated that up to 605 cfs overtopped the channel (Station 27+00). The majority of the channel overflow enters the left overbank area downstream of Station 27+00 which will impact Hacienda Avenue. The right overbank receives most of its overflow at the upstream end of the channel near Station 2+00. This water will pond in a low overbank area or flow in the parallel gullies which later reenter the channel through culverts.

SVE Diversion
Channel & Berm

SOUTHERN VISTA ESTATES DIVERSION CHANNEL AND BERM

SCOPE

Black & Veatch obtained as-built information on the SVE diversion channel and berm from the CCRFCD. This design and construction information was reviewed for structural compliance with the National Flood Insurance Program (NFIP 44CFR 65.10). The influence of the berm and channel on existing downstream flood zones was also verified against the as-built information.

SOUTHERN VISTA ESTATES SITE AND DRAINAGE INFORMATION

Southern Vista Estates includes a 35-acre single family resident (SFR) development and a 15-acre condominium site. The north boundary of the SFR property is adjacent and parallel to the UFWDB discharge channel. The condominium property is south of the SFR development. Both SVE properties are located in the path of drainage basins unaffected by the UFWDB.

In November 1992, Engineers and Surveyors Inc. (ESI) prepared a technical drainage study for the Clark County Department of Public Works. (The drainage study is included in Volume I of this submittal.) ESI identified a 520-acre offsite drainage area, composed of five basins, which impacted the SVE development but were not included in the UFWDB watershed. According to the HEC-1 model presented in the study, the total peak discharge from the five offsite drainage basins during a 100-year storm event is 688 cfs. ESI analyzed the impact on the UFWDB stage and storage capacity if the 688 cfs was diverted to the basin. Their findings, based on the original UFWDB 100-year pool elevation of 2469.6 feet and detained volume of 880 acre-feet, elevated the peak stage to 2470.3 feet and increased the basin volume by 63 acre-feet. The diverted flows increased the impoundment area by approximately five acres. This analysis conservatively assumed that two storms would be centered over both the UFWDB and SVE watersheds simultaneously.

As proposed in the drainage study, a diversion berm and channel was constructed to "extend" the south arm of the UFWDB embankment and divert stormwater runoff from the five offsite drainage basins into the UFWDB. The SVE project consisted of approximately 1100 feet of earthen berm and 1630 feet of trapezoidal earthen channel.

The diversion berm begins at Station 1+70 and is transformed into the diversion channel at Station 12+50. According to ESI's drainage study, three offsite basins (OFF1, OFF2, and OFF3) contribute a peak runoff of 491 cfs to the berm between Stations 1+70 and 6+00 during the 100-year event. An additional 164 cfs from offsite basin OFF4 reaches the berm between Stations 6+00 and 12+50. Runoff from OFF5, 38 cfs, reaches the channel near Station 26+00.

BERM ANALYSIS

The berm was analyzed to verify adequate capacity for conveying the stormwater runoff generated by the SVE offsite basins. The results were compared to the National Flood Insurance Program (NFIP 44CFR 65.10) requirements and CCRFCD *Hydrologic Criteria and Drainage Design Manual* guidelines.

Freeboard Requirements

According to NFIP 44CFR 65.10, the minimum freeboard requirement for riverine levees is three feet above the base flood water surface elevation. However, the upstream end of the levee (Station 1+70) is required to have an additional six inches of freeboard, for a total of 3.5 feet, and then taper to the minimum at the downstream end (Station 12+50). The NFIP minimum freeboard requirements may be reduced to two feet if adequate protection can be provided with the lesser freeboard. The local requirements established by CCRFCD require a minimum freeboard of one foot for a berm or channel.

Berm Performance

Cross sections were taken every 50 feet along the length of the berm and the flow area was calculated to within two feet of the top of the berm. This calculation provided the flow capacity with two feet of freeboard, the minimum allowed by NFIP 44CFR 65.10. To determine the available freeboard for the given flow (491 cfs between Stations 1+70 and 6+00 and 688 cfs from Stations 6+00 to 12+00), a "Depth vs Capacity" curve was plotted and the desired value was interpolated from the graph. The average freeboard for the berm was approximately 2.5 feet; the minimum freeboard provided was approximately 1.8 feet at Station 3+00. The flowline at the berm has a slope of 1.35 percent. To determine the berm capacity, Manning's Equation was applied using an "n" value of 0.032.

ESI based their design of the diversion berm and channel on the CCRFCD guidelines which require a minimum freeboard of one foot. This is considered adequate protection for this berm because the contributing watershed is finite, easily defined, and predictable. Cemented, highly stable soils were exposed in the beds of the existing washes prior to construction of the berm. This signifies that sediment accumulation at the berm would be negligible. In addition, the berm nearly parallels the natural channels at the point of interest. The Depth vs Capacity curves indicate that capacity increases greatly in the top two to three feet of berm height. This increase is typically at least six times the required flow capacity.

CHANNEL ANALYSIS

The channel cross section varies along its 1630-foot alignment, and three riprap-lined drop structures make up the grade differential between the existing ground and the channel flowline. The SVE channel was analyzed to verify adequate capacity to convey the entire 688 cfs generated in the offsite drainage basins. The following table lists the channel characteristics and capacity within the two reaches. Manning's Equation was applied using an "n" value of .035 for each calculation. The flow regime in both reaches is subcritical.

CHANNEL REACH CHARACTERISTICS (Q = 688 cfs)		
STATION	13+13.38 to 21+00.00	21+00.00 to 28+00.00
Slope (%)	0.30	0.30
Bottom Width	10'	20'
Bank Slope	2 : 1	2 : 1
Bank Height	7'	5' East, 4' West
Available Freeboard	1.13'	.42' East, -0.58' West
Velocity	5.39 fps	5.15 fps

According to the results obtained from Manning's equation, the downstream channel reach has inadequate freeboard. The east, or right, bank of the channel provides five inches of freeboard

under the peak flow conditions. The freeboard results published in the ESI drainage study indicate that the minimum freeboard provided on the east bank was 1.26 feet in this reach of the channel. The reason for the difference in freeboard allowances is that, according to the ESI's HEC-2 model input, the channel was analyzed for 491 cfs. This lower flow corresponds to the peak runoff from the three offsite basins which impact the upstream end of the berm. However, ESI's report indicated that the channel would be impacted by the peak runoff of 688 cfs based on the HEC-1 model output presented in the drainage study. The study does not explain the reason for using the lower flowrate in the HEC-2 program.

The berm and channel have the capacity to convey 688 cfs without overtopping the east banks and impacting the downstream development. Although the berm was analyzed for a flow of 491 cfs from Station 1+70 to Station 6+00, it will maintain a freeboard of at least one foot for a flow of 688 cfs along that reach. The peak flow of 688 cfs will exceed the west channel bank between Stations 21+00 and 28+00, but the overflow will be directed toward the UFWDB.

CONCLUSION

The SVE diversion berm and channel is a local drainage facility designed to divert flows from a small watershed into the UFWDB, a regional flood control facility. The SVE project was constructed to extend the south arm of the UFWDB and protect the Southern Vista Estates from offsite drainage. Although the diversion berm does not maintain the minimum freeboard requirements established by the NFIP 44CFR 65.10 for a short reach, the berm was considered adequate to mitigate the flood hazard from this finite and predictable watershed as it affects downstream areas. The minimum available freeboard on the berm is approximately 1.8 feet at Station 3+00 for a flow of 491 cfs; the average available freeboard along the berm is 2.5 feet. The downstream channel has adequate capacity to convey the Base Flood Event (688 cfs) to the UFWDB. The upstream reach of the channel between Stations 12+00 and 21+00 has an available freeboard of just over one foot. The minimum available freeboard for a flow of 688 cfs in the channel is five inches from Station 21+00 to 28+00.

FEDERAL EMERGENCY MANAGEMENT AGENCY
REVISION REQUESTOR AND COMMUNITY OFFICIAL FORM

O.M.B. Burden No. 3067-0148
Expires July 31, 1997

FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 2.13 hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

1. OVERVIEW

1. The basis for this revision request is (are): *(check all that apply)*
   - ☒ Physical change
     - ☒ Existing
     - ☐ Proposed
   - ☐ Improved methodology
   - ☐ Improved data
   - ☐ Floodway revision
   - ☒ Other Investigation of assumed flow diversion from Red Rock Wash to Flamingo Wash.
     Explain Response to FEMA Case No. 93-09-407R letter dated 7-26-93.
2. Flooding Source: Upper Flamingo Wash and Red Rock Wash.
3. Project Name/Identifier: Upper Flamingo Wash Detention Basin (UFWDB)
4. FEMA zone designations affected: A
   (example: A, AH, AO, A1-A30, A99, AE, V, V1-30, VE, B, C, D, X)
5. The NFIP map panel(s) affected for all impacted communities is (are):

Community No.	Community Name	County	State	Map No.	Panel No.	Effective Date
EX: 480301	Katy, City	Harris, Fort Bend	TX	480301	0005D	02/08/83
480287	Harris County	Harris	TX	48201C	0220G	09/28/90
320003	Clark County Unincorporated Areas	Clark County	NV	32003C	2535D	08/16/95

6. The area of revision encompasses the following types of flooding, structures, and associated disciplines: *(check all that apply)*

Types of Flooding	Structures	Disciplines*
☐ Riverine	☒ Channelization	☒ Water Resources
☐ Coastal	☐ Levee/Floodwall	☒ Hydrology
☒ Alluvial Fan	☐ Bridge/Culvert	☒ Hydraulics
☐ Shallow Flooding *(e.g. Zones AO and AH)*	☒ Dam	☒ Sediment Transport
☐ Lakes	☐ Coastal	☐ Interior Drainage
Affected by wind/wave action	☐ Fill	☒ Structural
☐ Yes	☐ Pump Station	☒ Geotechnical
☒ No	☐ None	☐ Land Surveying
	☐ Channel Relocation	☐ Other *(describe)*
	☐ Excavation	
	☐ Other *(describe)*	

☐ Other(describe)

* **Attach completed "Certification by Registered Professional Engineer and/or Land Surveyor" Form for each discipline checked. (Form 2)**

2. FLOODWAY INFORMATION

7. Does the affected flooding source have a floodway designated on the effective FIRM or FBFM? ☒ Yes ☐ No
8. Does the revised floodway delineation differ from that shown on the effective FIRM or FBFM ☒ Yes ☐ No
   If yes, give reason: Operation of UFWDB will reduce downstream floodway.

Attach copy of either a public notice distributed by the community stating the community's intent to revise the floodway or a statement by the community that it has notified all affected property owners and affected adjacent jurisdictions.

9. Does the State have jurisdiction over the floodway or its adoption by communities participating in the NFIP? ☐ Yes ☒ No

If yes, attach a copy of a letter notifying the appropriate State agency of the floodway revision and documentation of the approval of the revised floodway by the appropriate State agency.

3. PROPOSED ENCROACHMENTS

10. With floodways:

1A. Does the revision request involve fill, new construction, substantial improvement, or other development in the floodway? ☒ Yes ☐ No

1B. If yes, does the development cause the 100-year water surface elevation to increase at any location by more than 0.000 feet? ☒ Yes ☐ No Water surface elevation is only increased within limits of detention basin impoundment area, therefore, documentation required under 65.12 has not been provided.

11. Without floodways:

2A. Does the revision request involve fill, new construction, substantial improvement, or other development in the 100-year floodplain? ☐ Yes ☐ No

2B. If yes, does the cumulative effect of all development that has occurred since the effective SFHA was originally identified cause the 100-year water surface elevation to increase at any location by more than one foot (*or other surcharge limit if community or state has adopted more stringent criteria*)? ☐ Yes ☐ No

If the answer to either Items 1B or 2B is yes, please provide documentation that all requirements of Section 65.12 of the NFIP regulations have been met, regarding evaluation of alternatives, notice to individual legal property owners, concurrence of CEO, and certification that no insurable structures are impacted.

4. REVISION REQUESTOR ACKNOWLEDGMENT

12. Having read NFIP Regulations, 44 CFR Ch. I, parts 59, 60, 61, and 72, I believe that the proposed revision ☒ is ☐ is not in compliance with the requirements of the aforementioned NFIP Regulations.

5. COMMUNITY OFFICIAL ACKNOWLEDGMENT

13. Was this revision request reviewed by the community for compliance with the community's adopted floodplain management ordinances? ☒ Yes ☐ No

14. Does this revision request have the endorsement of the community? ☒ Yes ☐ No

If no to either of the above questions, please explain: _____

Please note that community acknowledgment and /or notification is required for all requests as outlined in Section 65.4 (b) of the NFIP Regulations.

6. OPERATION AND MAINTENANCE

15. Does the physical change involve a flood control structure (e.g., levees, floodwalls, channelization, basins, dams)? ☒ Yes ☐ No

If yes, please provide the following information for each of the new flood control structures:

A. Inspection of the flood control project will be conducted periodically by Clark County Department of Public Works (entity) with a maximum interval of 12 months between inspections.

B. Based on the results of scheduled periodic inspections, appropriate maintenance of the flood control facilities will be conducted by Clark County Department of Public Works. (entity) to ensure the integrity and degree of flood protection of the structure.

C. A formal plan of operation, including documentation of the flood warning system, specific actions and assignments of responsibility by individual name or title, and provisions for testing the plan at intervals not less than one year, ☒ has ☐ has not been prepared for the flood control structure.

D. The community is willing to assume responsibility for ☒ performing ☒ overseeing compliance with the maintenance and operation plans of the Upper Flamingo Wash Detention Basin. (Name)

flood control structure. If not performed promptly by an owner other than the community, the community will provide the necessary services without cost to the Federal government.

Attach operation and maintenance plans

7. REQUESTED RESPONSE FROM FEMA

16. After examining the pertinent NFIP regulations and reviewing the document entitled "Appeals, Revisions, and Amendments to Flood Insurance Maps: A guide for Community Officials," dated January 1990, this request is for a:

_____a.	CLOMR	*A letter from FEMA commenting on whether a proposed project, if built as proposed, would* justify a map revision *(LOMR or PMR)*, or proposed hydrology changes *(see 44 CFR Ch. I, Parts 60, 65, and 72).*
X b.	LOMR	A letter from FEMA officially revising the current NFIP map to show changes to floodplains, floodways, or flood elevations. LOMRs typically depict decreased flood hazards. *(See 44 CFR Ch. I Parts 60 and 65.)*
_____c.	PMR	A reprinted NFIP map incorporating changes to floodplains, floodways, or flood elevations. Because of the time and cost involved to change, reprint, and redistribute an NFIP map, a PMR is usually processed when a revision reflects increased flood hazards or large-scope changes. *(See 44 CFR Ch. I, Parts 60 and 65.)*
_____d.	Other:	Describe_____

8. FORMS INCLUDED

17. Form 2 entitled, "Certification By Registered Professional Engineer and/or Land Surveyor" must be submitted.

The following forms should be included with this request if (check the included forms):

• Hydrologic analysis for flooding source differs from that used to develop FIRM	☒ Hydrologic Analysis Form (Form 3)
• Hydraulic analysis for riverine flooding differs from that used to develop FIRM	☐ Riverine Hydraulic Analysis Form (Form 4)
• The request is based on updated topographic information or a revised floodplain or floodway delineation is requested	☐ Riverine /Coastal Mapping Form (Form 5)
• The request involves any type of channel modification	☒ Channelization Form (Form 6)
• The request involves new bridge or culvert or revised analysis of an existing bridge or culvert	☐ Bridge/Culvert Form (Form 7)
• The request involves a new revised levee/floodwall system	☒ Levee/Floodwall System Analysis Form (Form 8)
• The request involves analysis of coastal flooding	☐ Coastal Analysis Form (Form 9)
• The request involves coastal structures credited as providing protection from the 100-year flood	☐ Coastal Structures (Form 10)
• The request involves an existing, proposed, or modified dam	☒ Dam Form (Form 11)
• The request involves structures credited as providing protection from the 100-year flood on an alluvial fan	☐ Alluvial Fan Flooding Form (Form 12)

9. INITIAL REVIEW FEE

18. The minimum initial review fee for the appropriate request category has been included. ☐ Yes ☒ No

Initial fee amount: $ _____

Check or money order only. Make check or money order payable to : **National Flood Insurance Program**. If paying by Visa or Mastercard please refer to the credit card information form which follows this form.

or

19. This request is for a project that is for public benefit and is primarily intended for flood loss reduction to insurable structures in identified flood hazard areas which were in existence prior to the commencement of construction of the flood control project. ☐ Yes ☒ No

or

20. This request is to correct map errors, to include the effects of natural changes within the areas of special flood hazard, or solely to provide more detailed data. ☒ Yes ☐ No

Note: I understand that my signature indicates that all information submitted in support of this request is correct.

95 OCT 5 P3:53 RECEIVED

Federal Emergency Management Agency

Washington, D.C. 20472

SEP 27 1995

Mr. Kevin Eubanks, P.E.
Assistant General Manager
Clark County Regional Flood
Control District
301 East Clark Avenue
Suite 301
Las Vegas, Nevada 89101

Dear Mr. Eubanks:

This is in response to your letter dated September 14, 1995, regarding the August 27, 1993, Conditional Letter of Map Revision (CLOMR) to the effective Flood Insurance Rate Map (FIRM) for the unincorporated areas of Clark County, Nevada. In the August 27 CLOMR, we identified the additional information required for us to revise the FIRM to represent the Upper Flamingo Wash Detention Basin (UFWDB) and the proposed diversion channel as providing protection against the flood having a 1-percent chance of being equaled or exceeded in any given year (base flood).

One of the items identified in the CLOMR was an officially adopted maintenance and operation plan for the UFWDB. The CLOMR indicated this plan may be in the form of a written statement from the community Chief Executive Officer, an ordinance, or other legislation and should include information regarding the nature of the maintenance activities, the frequency with which they will be performed, and the title of the local community official who will be responsible for ensuring that the maintenance activities are accomplished. With your letter, you submitted a copy of the Interlocal Contract, Annual Maintenance Program, executed by and between the Clark County Regional Flood Control District (CCRFCD) Board of Directors and Clark County for the current year (Fiscal Year 95/96). The contract states maintenance will be performed in accordance with the CCRFCD Operations and Maintenance Manual. You indicated the UFWDB is included in Item CLA12, Detention Basins, of Exhibit A to the contract, which allocates maintenance funding. You also provided information identifying the Project Manager responsible for the maintenance.

The submitted contract addresses the issue of maintenance of the UFWDB for the current year. Upon receipt of the additional required data, as listed in the CLOMR, we will make a final determination on revising the effective FIRM. If the additional data are provided after the expiration date of the current contract, June 30, 1996, we will require a copy of the contract in effect at the time the data are submitted.

If you have any questions regarding this matter, please contact Mr. John Magnotti of our staff in Washington, DC, either by telephone at (202) 646-3932 or by facsimile at (202) 646-4596.

Sincerely,

Michael K. Buckley, P.E., Chief

Upper Flamingo Wash Detention Basin CLOMR
Case No.: 93-09-407R

Dear Mr. Locke:

This letter is written in response to the Conditional Letter of Map Revision (CLOMR) dated August 27,1993, for the above-referenced case. A condition of the CLOMR is submittal of a maintenance and operation plan for the Upper Flamingo Wash Detention Basin (UFWDB). The following is offered to address that condition.

The Clark County Regional Flood Control District (CCRFCD) has established a master plan of facilities to control stormwater runoff within Clark County. Projects identified within the master plan are eligible for maintenance funding provided by the CCRFCD. The UFWDB is included on the master plan and has its maintenance and operation funded by the CCRFCD.

The various governmental entities within Clark County take the lead in procuring and expending CCRFCD funds for design, right-of-way acquisition, construction, and maintenance and operation of the facilities included on the master plan. Each project "belongs" to the individual entity who owns the rights-of-way on which they are constructed. Maintenance work plans and interlocal funding contracts are developed annually by each entity in support of their request to the CCRFCD Board of Directors for maintenance and operation funds.

Enclosed please find a copy of the Interlocal Contract, Annual Maintenance Program executed by the CCRFCD Board of Directors for the current year (FY 95/96) for Clark County. Exhibit A, Page 3, Item CLA12 of the County's contract provides maintenance funding for detention basins which includes the UFWDB.

301 E. Clark Avenue, Suite 301 • Las Vegas, Nevada 89101
(702) 455-3139 • FAX: (702) 455-3870

I hope this information adequately addresses the issue of continued maintenance of this important flood control facility. A copy of this letter will be included in a package of technical data to be submitted at a later date which addresses the remaining conditions stated in the subject CLOMR. If I can be of any further assistance, please call.

Sincerely,

Kevin Eubanks, P.E.
Assistant General Manager

UFDB LOMR

INTERLOCAL CONTRACT

ANNUAL MAINTENANCE PROGRAM

THIS CONTRACT, made and entered into this 13th day of July, 1995, by and between the County of Clark, a political subdivision of the State of Nevada, hereinafter referred to as "County", and the CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT, hereinafter referred to as "District".

WITNESSETH

WHEREAS, pursuant to Chapter 543 of the Nevada Revised Statutes, the District may approve and fund projects to maintain flood control improvements; and

WHEREAS, The County desires to maintain flood control improvements located in (see Exhibit "A") accordance with the maintenance program set forth herein, and hereinafter referred to as "Project"; and

WHEREAS, the facility upon which maintenance will be done is a facility described in the District's Master Plan.

NOW, THEREFORE, in consideration of the covenants, conditions, agreements, and promises of the parties hereto, the District authorizes the Project as it is mutually understood and agreed as follows:

SECTION I - SCOPE OF PROJECT

This Interlocal Contract applies to the maintenance of flood control facilities, which are identified in the District's Master Plan facilities including updates and amendments subsequently approved. The basic maintenance to the facilities will be in accordance with

performance standards of the Operations and Maintenance Manual. The Project is more specifically described in Exhibit "A" which is attached hereto and by this reference incorporated herein.

SECTION II - PROJECT COSTS

The District agrees to provide reimbursement for Project costs within the limits specified below:

1. The Project costs shall not exceed $1,301,700.00. The amounts allocated to each individual facility within the Project must be specified in Exhibit "A". Any changes to said allocated amounts must be approved by the District's Chief Engineer.

   A written request must be made to the District and a Supplemental Interlocal Contract approved to increase the amount noted above prior to payment of any additional funds.

2. The County and District will comply with Section 4.12 of the Operation and Maintenance Manual. In accordance with said manual the County shall submit invoices together with a detailed summary report of the maintenance service performed. The County shall submit an Invoice Voucher prepared in duplicate in the manner prescribed by the District. The vouchers shall include such information as is necessary for the District to determine the nature of all expenditures. Each voucher will clearly indicate that it is for services rendered in performance under this contract. Each voucher will also be accompanied by a written certification from the County stating that it is for performance of maintenance activities under this contract and is composed of completed elements set forth in the annual work program.

All invoices must be submitted for payment to:

Clark County Regional Flood Control District
301 E. Clark Avenue, Suite 301
Las Vegas, Nevada 89101
Attn: Gale Wm. Fraser, P.E.
General Manager/Chief Engineer

Payment shall be considered timely if made by the District within 45 days. Pursuant to Section IV, Paragraph 6, the District may, in its sole discretion, withhold payments to the County for services rendered if the County fails to satisfactorily comply with any term or condition of this contract and/or the District's Operation and Maintenance Manual.

SECTION III - PROJECT TIME

The County agrees to perform the Project to the satisfaction of the District prior to June 30, 1996. The District may grant extensions or terminate this contract and require all sums advanced to the County to be repaid if the County fails to perform by said date.

SECTION IV - GENERAL

1. The County will complete the Project as set forth in Exhibit "A". The County staff personnel responsible for coordination work under this contract are as listed below:
M. J. Manning, Director of Public Works, or his designee:
It is understood that staff named above will be responsible for work coordination throughout the period of this contract unless the District is informed in writing of changes in these personnel assignments.

2. In addition to the specific terms set forth in this Contract the parties hereto shall be subject to and governed by the District's Operation and Maintenance Manual, and any applicable portions of the Policies and Procedures adopted by the District.

3. It is the intent of the District that scheduling of maintenance and repair of drainage and flood control facilities in general and Master Plan Facilities specifically be coordinated among entities. Therefore, in those cases where Master Plan approved,

and District - funded projects have regional flood control significance impacting more than one entity, the County will allow all impacted entities an opportunity to review the maintenance schedule in order to coordinate maintenance efforts.

4. The Chief Engineer of the District shall be responsible for monitoring the performance of the County, approval for payment of billings and expenses submitted by the County, and the acceptance of any reports provided by the County. The County shall be responsible for monitoring performance of County staff or private contractors, and the County shall maintain detailed records of all payments made to contractors and make such records available to the District upon request.

5. The County shall provide right of access to its facilities to the District or Chief Engineer at all reasonable times, in order to monitor and evaluate performance, compliance, and/or quality assurance under this contract.

6. In the event the County fails to perform the maintenance according to the standards specified in this contract and in the District's Operation and Maintenance Manual, the District may perform or cause to be performed the maintenance necessary to assure proper operation of the facility. Cost incurred by the District shall be reimbursed by the County or be deducted from the amount authorized by this contract. The District may not exercise this right without giving the County specific written notice of the maintenance required and allowing the County 60 days within which to perform said maintenance.

The notice required by this provision must be sent to:

M. J. Manning, Director
Department of Public Works
6655 W. Sahara Ave. Bldg. C-204
Las Vegas, Nevada 89102

7. The records of the County and/or private contractors pertaining to the subject matter of this contract shall at all reasonable times be subject to inspection and audit by the District, County Auditor or an Agent of the District.

8. If any provision of this contract shall be deemed in conflict with any statute or rule of law, such provision shall be deemed modified to be in conformance with said statute or rule of law.

9. All parties to this contract shall comply with applicable local, state, and federal laws.

10. Any costs found to be improperly allocated in the project will be refunded by the County to the District.

11. It is specifically understood and agreed to by and between the parties hereto that it is not intended by any of the provisions of any part of this contract to create in the public or any member thereof a third party beneficiary hereunder, or to authorize anyone not a party to this contract to maintain a suit for personal injuries or property damage pursuant to the terms of provisions of this contract.

12. The County hereby indemnifies and shall defend and hold harmless the District, its representatives and their employees (or their authorized representatives) from and against any and all suits, actions, legal or administrative proceedings, claims, demands, damages, liabilities, interest, attorney's fees, costs and expenses whatsoever of any kind or nature whether arising before or after completion of the work hereunder and in any manner directly or indirectly caused, occasioned or contributed to in whole or in

part, by reason of any act, omission, fault or negligence whether active or passive of the County, of anyone acting under its direction or control, or on its behalf in connection with or incident to the performance of this Contract. The County's aforesaid indemnity and hold harmless obligations, or portions or applications thereof, shall apply to the fullest extent permitted by law, but in no event shall they apply to liability caused by the sole negligence or willful misconduct of the party indemnified or held harmless.

IN WITNESS WHEREOF: The parties have caused this contract to be executed the day and year first above written.

FEDERAL EMERGENCY MANAGEMENT AGENCY **CERTIFICATION BY REGISTERED PROFESSIONAL ENGINEER AND/OR LAND SURVEYOR FORM**	O.M.B. Burden No. 3067-0148 Expires July 31, 1997	FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average . 23 hour per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067- 0148), Washington, DC 20503.

1. This certification is in accordance with 44 CFR Ch. I, Section 65.2
2. I am licensed with an expertise in geotechnical engineering.
   [example: water resources *(hydrology, hydraulics, sediment transport, interior drainage)** structural, geotechnical, land surveying.]
3. I have 8 years experience in the expertise listed above.
4. I have ☐ prepared ☒ reviewed the attached supporting data and analyses related to my expertise.
5. I ☒ have ☐ have not visited and physically viewed the project.
6. In my opinion, the following analyses and /or designs, is/are being certified:

   Engineering analysis, design, and construction of the Upper Flamingo Wash Detention Basin.
7. Base upon the following review, the modifications in place have been constructed in general accordance with plans and specifications.

   Basis for above statement: (check all that apply)

   a. ☒ Viewed all phases of actual construction.
   b. ☒ Compared plans and specifications with as-built survey information.
   c. ☒ Examined plans and specifications and compared with completed projects.
   d. ☐ Other _____
8. All information submitted in support of this request is correct to the best of my knowledge. I understand that any false statement may be punishable by fine or imprisonment under Title 18 of the United States Code, Section 1001.

FEDERAL EMERGENCY MANAGEMENT AGENCY

CERTIFICATION BY REGISTERED PROFESSIONAL ENGINEER AND/OR LAND SURVEYOR FORM

O.M.B. Burden No. 3067-0148
Expires July 31, 1997

FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average . 23 hour per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067- 0148), Washington, DC 20503.

1. This certification is in accordance with 44 CFR Ch. I, Section 65.2
2. I am licensed with an expertise in structural engineering.
   [example: water resources *(hydrology, hydraulics, sediment transport, interior drainage)** structural, geotechnical, land surveying.]
3. I have 8 years experience in the expertise listed above.
4. I have ☐ prepared ☒ reviewed the attached supporting data and analyses related to my expertise.
5. I ☒ have ☐ have not visited and physically viewed the project.
6. In my opinion, the following analyses and /or designs, is/are being certified:

   Engineering analysis, design, and construction of the Upper Flamingo Wash Detention Basin.
7. Base upon the following review, the modifications in place have been constructed in general accordance with plans and specifications.

   Basis for above statement: (check all that apply)

   a. ☒ Viewed all phases of actual construction.
   b. ☒ Compared plans and specifications with as-built survey information.
   c. ☒ Examined plans and specifications and compared with completed projects.
   d. ☐ Other _____
8. All information submitted in support of this request is correct to the best of my knowledge. I understand that any false statement may be punishable by fine or imprisonment under Title 18 of the United States Code, Section 1001.

FEDERAL EMERGENCY MANAGEMENT AGENCY **HYDROLOGIC ANALYSIS FORM**	O.M.B. Burden No. 3067-0148 Expires July 31, 1997	FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 3.67 hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

Community Name: Clark County, NV

Flooding Source: Flamingo Wash and Red Rock Wash
(One form for each flooding source)

Project Name /Identifier: Upper Flamingo Wash Detention Basin (UFWDB)

1. HYDROLOGIC ANALYSIS IN FIS

- ☐ Approximate study stream (Zone A)
- ☒ Detailed study stream (briefly explain methodology) HEC-1 computer model.

2. REASON FOR NEW HYDROLOGIC ANALYSIS

- ☐ No existing analysis
- ☐ Improved data *(see data revision on page 3)*
- ☒ Changed physical conditions of watershed *(explain)* (1) Upper Flamingo Wash Detention Basin has been constructed on the Flamingo Wash. (2) Per FEMA letter dated 7-26-93, diversion of flows from Red Rock Wash to the UFWDB are assumed to occur.
- ☐ Alternative methodology *(justify why the revised model is better than model used in the effective FIS)*
- ☐ Evaluation of proposed conditions (CLOMRs only) (explain)
- ☐ Other

If a computer program/model was used in revising the hydrologic analysis, please provide a diskette with the input files for the 10-, 50-, 100 - and 500-year recurrence intervals.

Only the 100-year recurrence interval need be included for SFHAs designated as Zone A.

3. APPROVAL OF ANALYSIS

- ☒ Approval of hydrologic analysis, including the resulting peak discharge value (s) has been provided by the appropriate local, state, or Federal Agency. (i.e., Clark County Regional Flood Control District. See letter dated 9-14-95.)
  Attach evidence of approval.
- ☐ Approval of the hydrologic analysis is not required by any local, State, or Federal Agency.

Stream: Upper Flamingo Wash

Comparison of 100-year Discharges

Location:	Drainage area (Sq mi.)	FIS (cfs):	Revised (cfs):
Project site per FEMA map dated 8-16-95	unknown	unknown	
UFWDB inflow	87.6		6660
UFWDB outflow			2,579

Note: When revised discharges are not significantly different than FIS discharges, FEMA may require a confidence limits analysis on attachment D at a later date to complete the review.

As is often the case with revision requests, only a portion of a stream may actually be revised or be affected by a revision. Therefore, transition to the unrevised portion is important to maintain the continuity of the study. NFIP regulations stipulate that such a transition must be assured. What is the transition from the proposed discharges to the effective discharges? Please explain how the transition was made *(attach separate sheet if necessary)*

ATTACH A COMPLETED REVIEW OF RESULTS PAGE FOR EACH FLOODING SOURCE.

Is the new hydrologic analysis being developed solely to revise the flow values presented in the FIS *(i.e. no changed hydraulic conditions)*? ☐ Yes ☒ No

If yes, does the 100-year water surface elevation change by 1.0 foot or more? ☐ Yes ☐ No

FEMA does not normally revise NFIP maps solely due to insignificant flow changes where changes in 100-year water surface elevation are less than 1.0 foot. (Note: BFEs not indicated on FEMA map #32003C2535D dtd. 8-16-95.)

5. HISTORICAL FLOODING INFORMATION

Is historical data available for the flooding source? ☐ Yes ☒ No

If yes, provide the following:

Location along flooding source: _____

Maximum peak discharge: _____ cfs

Second highest peak discharge: _____ cfs

Source of information: _____

6. GAGE RECORD INFORMATION

Location of nearest gage to project site *(along flooding source or similar watershed; specify)*

None

Gaging Station: _____

Drainage area at gage: _____ mi^2

Number of years of data: _____

7. DATA REVISION

Please use the following table to list all the data and/or parameters affected by this request and identify them as new data (*New*) or as revising existing data (*Revised*). *(If necessary, attach a separate sheet.)*

Data Parameter	New	Revised	Data Source
Drainage Area	☐	☒	USGS maps & JMM models
Subbasin Routing	☐	☒	USGS maps & CCRFCD manual
Depth Area Reduction Factor	☐	☒	CCRFCD manual
	☐	☐	
	☐	☐	

- Data source can be from a Federal, State, or local government agency, or from a private source. Some State and local governments may have less strict data requirements than Federal agencies, in which case the hydrologic data may not be accepted by FEMA unless it is demonstrated that the data give a better estimate of the flood discharge.
- Attach documentation corroborating each data source *(i.e., certified statement, report, bibliographical reference to a published document)*. In the case of a published document or a government report, providing copies of the cover and pertinent pages may be helpful. See attached.

8. METHODOLOGY FOR NEW ANALYSIS

☐ Statistical Analysis of Gage Records (*use Attachment A*)

☐ Regional Regression Equations *(use Attachment B)*

☒ Precipitation/Runoff Model *(use Attachment C)*

☐ Other *(specify; attach backup computations and supporting data)* _____

_____

ATTACHMENT A: STATISTICAL ANALYSIS OF GAGE RECORDS

Gaging Station: N/A

Gage Location (latitude and longitude): _____

	FIS:	Revised:
1. Number of years of data		
Systematic		
Historical		
2. Homogeneous data	☐ Yes ☐ No	☐ Yes ☐ No
3. Data adjustments	☐ Yes ☐ No	☐ Yes ☐ No
4. Number of high outliers		
Low outliers		
Zero events		
5. Generalized skew		
6. Station skew		
7. Adopted skew		
8. Probability distribution used (justify if log-Pearson III was not used)		
9. Transfer equations to ungaged sites		☐ Yes ☐ No

If yes, specify method

_____

_____

_____

10. Expected probability* ☐ Yes ☐ No

11. Comparison of results with other analyses ☐ Yes ☐ No

If yes, describe comparison

_____

_____

_____

*FEMA does not accept expected probability analyses for the purpose of reflecting flood hazard information in a FIS.

If any data is not available, indicate by N/A.

Attach analysis including plot of flood frequency curve.

ATTACHMENT B: REGIONAL REGRESSION EQUATIONS

1. Bibliographical Reference:

N/A

(Attach a copy of title page, table of contents, and pertinent pages including equations.)

2. Gaged or ungaged stream: _____

3. Hydrologic region(s): _____
Attach backup map.

4. Provide parameters, values, and source of data used to define parameters.

		FIS:		Revised:	
5.	Urbanized conditions calculations	☐ Yes	☐ No	☐ Yes	☒ No
6	Percent of watershed urbanization	_____		_____	
7.	Is the watershed controlled?	☐ Yes	☐ No	☐ Yes	☐ No
8.	Comparison with other analyses	☐ Yes	☐ No	☐ Yes	☐ No

If the answer to 5, 7, or 8 is yes, explain methodology in Comments.

If data is not available, indicate by N/A.

Comments

Attach computation and supporting maps, delineating the watershed boundary and drainage area divides.

ATTACHMENT C: PRECIPITATION/RUNOFF MODEL

		FIS: (JMM model)	Revised
1.	Method or model used:	HEC-1	HEC-1
	Version:	4.0	4.0
	Date:	9/90	9/90
2.	Source of rainfall depth:	NOAA Atlas 2	JMM model
3.	Source of rainfall distribution:	CCRFCD manual	JMM model
4.	Rainfall duration:	6 hours	6 hours
5.	Areal adjustment to precipitation (%):	0.81 (CCRFCD)	0.62 (CCRFCD)
6.	Maximum overland flow length	CCRFCD manual	JMM model
7.	Hydrograph development method:	SCS	JMM model
8.	Loss rate method:	SCS Curve Number	JMM model
	Source of soils information:	SCS Soils map	JMM model
	Source of land use information		
9.	Channel routing method:	Muskingum	Muskingum
10.	Reservoir routing:	☒ Yes ☐ No	☒ Yes ☐ No
11.	Baseflow considerations:	☐ Yes ☒ No	☐ Yes ☒ No

If yes, explain how baseflow was determined:

N/A

12.	Snowmelt considerations:	☐ Yes ☒ No	☐ Yes ☒ No
13.	Model calibration:	☒ Yes ☐ No	☐ Yes ☒ No

If yes, explain how calibration was performed Calibration of FIS models with COE flows by James M. Montgomery Engineers. See attached documentation.

14. Future land use condition: ☐ Yes ☒ No

If yes, explain why

NOTE: FEMA policy is to base flooding on existing conditions.
If data is not available, indicate by N/A.

Attach precipitation/runoff model, hydrologic model schematic, curve number calculations, time of concentration calculations, and supporting maps, delineating the watershed boundary and drainage area divides. See report for revised HEC-1 printouts and hydrologic model discussion.

Stream: N/A

Select one location for Confidence Limits Evaluation (*describe location*): _____

_____

Discharges for selected location:

Exceedance Probability		FIS	Revised
10%	(10-year)	_____ cfs	_____ cfs
2%	(50-year)	_____ cfs	_____ cfs
1%	(100-year)	_____ cfs	_____ cfs
0.2%	(500-year)	_____ cfs	_____ cfs

1% (100-year) Flood Confidence Intervals

90% Confidence Interval: 5% limit _____ cfs

95% limit _____ cfs

50% Confidence Interval: 25% limit _____ cfs

75% limit _____ cfs

If the value of the 100-year frequency flood in the FIS is beyond the 50% confidence interval but within the 90% confidence interval, does the 100-year water surface elevation change by 1.0 foot or more? ☐ Yes ☐ No

An example of confidence limits analysis can be found in Appendix 9 of Bulletin 17B.

Attach Confidence Limits Analysis.

Clark County Regional Flood Control District

Las Vegas Valley Flood Insurance Study Hydrology Report

September 1991

JMM James M. Montgomery
Consulting Engineers, Inc.

chapter. A separately bound Technical Appendix contains HEC-1 routing diagrams and input/output printouts for 100-year flood simulations.

BASIC DATA AND ASSUMPTIONS

The key previous studies referenced in this work which affect the overall Las Vegas Valley study area are:

Hydrologic Documentation for Feasibility Study, Las Vegas Wash and Tributaries, U.S. Army Corps of Engineers, Los Angeles District, 1986
Clark County Flood Insurance Study (draft), JMM, 1985
Clark County Flood Control Master Plan, JMM, 1986
Special Flood Hazard Study, Las Vegas Wash and Tributaries, U.S. Army Corps of Engineers, Los Angeles District, 1988

The Master Plan utilized hydrologic modeling data from the FIS in drainage areas beyond the anticipated development boundary. The Corps of Engineers (COE) Special Flood Hazard Study, which was prepared as a supplement to the Feasibility Study for Las Vegas Wash and Tributaries, incorporated much of the Master Plan modeling information.

Existing land use information was based on digitized land use data provided by Clark County Comprehensive Planning (1986), supplemented by information obtained from an April 1990 aerial photograph. Thus land use conditions are considered accurate as of April 1990. Soils data were obtained from the SCS Soil Survey for Las Vegas Valley (1985). Subbasin boundaries were adopted from previous studies to the greatest extent possible; where necessary, additional subbasins were delineated based on 7.5 minute USGS maps, recent drainage studies, and aerial photos.

Modeling methods were selected to be consistent with the CCRFCD manual. Design storms were 6-hour events with depths as given in the manual. Storm distributions were SDN #3 (for areas under 10 square miles) and SDN #5 (for areas over 10 square miles), as developed by the COE. Point precipitation was reduced by depth-area reduction factors (DARF's) given in the CCRFCD Manual. Unique DARF's were computed for each concentration point of interest based on contributing drainage area or assumed upstream storm area. Hydrographs were computed from rainfall excess using the SCS unit hydrograph method, except in subbasins where kinematic runoff parameters were already available. The Muskingum routing method was used for channel routing except where improved channels were involved, in which case the kinematic method was used. Losses were computed using the SCS curve number (CN) method, based on standard CN tables provided in the CCRFCD manual.

HEC-1 models were executed using the 1988 version of the program. Although this program version is provisional and contains some "bugs" associated with use of the kinematic routing routine (although not in the kinematic algorithm itself), it was selected because it was the most recent version of the program being distributed and because it gives results which should agree better with the recently released 1990 HEC-1 version than would the 1985 version.

Because the new FIS modeling was based primarily on the COE existing conditions analysis, and because local entities generally accept the COE results, one of the objectives of the new analysis was to produce results consistent with the COE flows at common points of interest. The CCRFCD has adopted 100-year COE flows for Las Vegas Wash, Range Wash, Flamingo Wash, Tropicana Wash, Duck Creek, Blue Diamond Wash, Pittman Wash, and C-1 Channel

as official "regulatory discharges" (see Appendix A). Certain COE flows for Range Wash, Flamingo Wash, Tropicana Wash, Blue Diamond Wash, Pittman Wash and C-1 Channel were identified as "interim discharges" due to concerns over their accuracy. It was hoped that conversion of the uniform loss rate method used by the COE to the curve number method recommended by CCRFCD, and other necessary model modifications, would produce results directly consistent with the COE discharges. At most model concentration points this was the case. At the remaining concentration points, model parameters (e.g., curve numbers and routing parameters) had to be adjusted within an acceptable range of values in order to better reproduce the COE flows. Thus, FIS flows were "calibrated" to the COE flows in order to assure reasonableness. Comparison within 10 percent was considered acceptable, although reasonable efforts were made to gain agreement to within 5 percent. It was felt that agreement of FIS flows at concentration points common to the COE study would allow discharges at non-COE concentration points to be computed which would be consistent with the COE flood frequency results. At the direction of CCRFCD, if modeled flows agree with regulatory discharges to within 10 percent, then the regulatory discharges will be adopted as FIS discharges.

The aggressive program of CCRFCD and each of the local agencies to design and construct major flood control facilities in Las Vegas Valley has lead to a "moving target" situation with regard to the definition of existing facilities. The proposed projects included in this FIS Hydrology study are based on information available in early 1991. When actual floodplain mapping is performed for FIS purposes, it will be important to assure that the assumed "existing conditions" in this hydrology study are correct; if not, the hydrology models will have to be revised accordingly.

In the remainder of this report, the terms "FIS Hydrology" and "FIS Model" refer to the flows and modeling developed for the present study, rather than to the 1985 draft Clark County Flood Insurance Study. Any differences in this terminology are clearly identified.

Prepared by:

WRC ENGINEERING, INC.

FEDERAL EMERGENCY MANAGEMENT AGENCY **CHANNELIZATION FORM**	*O.M.B. Burden No. 3067-0148* *Expires July 31, 1997*	**FEMA USE ONLY**

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 1.75 hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

Community Name: Clark County, NV

Flooding Source: Flamingo Wash and Red Rock Wash

Project Name/Identifier: Upper Flamingo Wash Detention Basin (UFWDB)

1. EXTENT OF CHANNELIZATION

Downstream limit: Hacienda Avenue box culvert

Upstream limit: UFWDB outfall

2. CHANNEL DESCRIPTION

1. **Describe the inlet to the channel.** Discharge through an 8'x7' uncontrolled orifice in lower portion of UFWDB spillway wall.

2. **Briefly describe the shape of the channel** ***(both cross sectional and planimetric configuration)*** **and its lining** ***(channel bottom and sides)*** Trapezoidal channel with 20' bottom width and 2H:1V side slopes. The 2,900-foot long channel has a 6-ft wide concrete low-flow channel w/curbs. The remaining channel is lined w/gabion mattresses in heights ranging from 6.0' to 8.5'.

3. **Describe the outlet from the channel.** Discharge into existing box culvert at Hacienda Avenue.

4. **The channelization includes:**

   - ☐ **Levees** ***(Attach Levee Form)***
   - ☒ **Drop structures** One 1.77-foot gabion drop structure @ Sta. 6+65.00
   - ☒ **Superelevated sections** Right bank only from Sta. 23+12.25 to Sta. 30+12.05
   - ☐ **Transitions in cross sectional geometry**
   - ☐ **Debris basin/detention basin**
   - ☒ **Energy dissipater** baffle blocks on spillway apron prior to channel inlet.
   - ☐ **Other**

5. **Attach the following:**
   As-Built drawings, sheets 1-23, included.

   a. **Certified engineering drawings showing channel alignment and locations of inlet, outlet, and items checked in item 4**

   b. **Typical cross sections and profiles of channel banks and invert**

3. HYDRAULIC CONSIDERATIONS

1. What is the 100-year discharge? ..... 2579 cfs
2. Do the cross sections in the hydraulic model match the typical cross sections in the plans? ☒ Yes ☐ No
3. Are the channel banks higher than the 100- year flood elevations everywhere? ..... ☐ Yes ☒ No
4. Are the channel banks higher than the 100-year flood energy grade lines everywhere? .. ☐ Yes ☒ No
5. Is the land on both sides of the channel above the adjacent 100-year flood elevation at all points along the channel? ..... ☐ Yes ☒ No
6. What is the range of freeboard? ..... -0.45' - +0.59 feet
7. What is the range of the 100-year flood velocities? ..... 7.61 - 15.46 ft/sec
8. What is the lining type? (both bottom and sides) concrete low-flow channel w/gabion mattress lining.

   Explain how the channel lining prevents erosion and maintains channel stability *(attach documentation)*

   Channel cross section is uniform, curb on low-flow channel, gabion mattresses underlined w/geotextile fabric. (Design for erosion & stability control based on 100-yr. peak discharge of 1225 cfs.)
9. What is the design elevation in the channel based on? (Design flow = 1225 cfs)
   - ☒ Subcritical flow - Sta. 1+46.44 to Sta. 6+65.00 and Sta. 28+00.00 to Sta. 30+43.62
   - ☐ Critical flow
   - ☒ Supercritical flow - Sta. 6+65.00 to Sta. 28+00.00
   - ☐ Energy grade line

   Is 100-year flood profile based on the above type of flow? ..... ☒ Yes ☐ No

   If no, explain: _____
10. Is there the potential for a hydraulic jump at the following locations?

    Inlet to channel ..... ☐ Yes ☒ No
    Outlet of channel ..... ☐ Yes ☒ No
    At Drop Structures ..... ☐ Yes ☒ No
    At Transitions ..... ☐ Yes ☒ No
    Other locations. Explain: Sta. 28+00.00 where flow regime changes from supercritical to subcritical.

    If the answer to any of the above is yes, please explain how the hydraulic jump is controlled and the effects of the hydraulic jump on the stability of the channel.

    Explain: The potential hydraulic jump is not controlled under the revised peak flow conditions. Channel stability may be impacted since flow may exceed gabion lining height and may not be contained in the channel.

4. SEDIMENT TRANSPORT CONSIDERATIONS

1. A. Is there any indication from historical records that sediment transport (including scour and deposition) can affect the 100-year water surface elevations and/or the capacity of the channel? ..... ☐ Yes ☒ No

   B. Based on the conditions of the watershed and stream bed, is there a potential for sediment transport (including scour and deposition) to affect the 100-year water surface elevations and /or the capacity of the channel? ..... ☒ Yes ☐ No

2. If the answer to either 1A or 1B is yes:

   A. What is the estimated sediment (bed) load?
   _____cfs (attach gradation curve)

   Explain method used to estimate load. The estimated sediment load was not determined since the majority of sediment will remain in the detention basin. See report for sediment loading on detention basin.

   B. Is the 100-year flood velocity anywhere within the channel less than the 100-year flood velocity of the inlet? ☒ Yes ☐ No

   C. Will sediment accumulate anywhere within the channel? ☒ Yes ☐ No
   Upstream of Hacienda Ave. box culvert.

   D. Will deposition or scour occur at or near the inlet? ☒ Yes ☐ No
   Deposition will occur within the detention basin.

   E. Will deposition or scour occur at or near the outlet? ☒ Yes ☐ No
   Upstream of Hacienda Ave. box culvert.

   Attach documentation showing affects on the Hydrologic and Hydraulic analyses
   See report.

FEDERAL EMERGENCY MANAGEMENT AGENCY **LEVEE/FLOODWALL SYSTEM ANALYSES FORM**	*O.M.B. Burden No. 3067-0148* *Expires July 31, 1997*	FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 3.0. hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

Community Name: Clark County, NV

Flooding Source: Unnamed minor tributary to Flamingo Wash

Project Name/Identifier: Southern Vista Estates Diversion Berm and Channel

REACH TO BE REVISED

Downstream limit: Hacienda Avenue and Buffalo Drive intersection

Upstream limit: 0.86 sq. mi. drainage area tributary to Southern Vista Estates development

This Levee/Floodwall analysis is based on:

- ☐ upgrading of an existing levee/floodwall system
- ☒ a newly constructed levee/floodwall system
- ☐ reanalysis of an existing levee/floodwall system

LEVEE/FLOODWALL SYSTEM ELEMENTS

1. Levee elements and locations are:

☒ earthen embankment, dike, berm etc.	Station 1+70 to 12+50
☐ structural floodwall	Station _____ to _____
☒ other (describe) channel (earthen)	Station 12+50 to 29+00

Structural Type:

- ☐ monolithic cast-in place reinforced concrete
- ☐ reinforced concrete masonry block
- ☐ sheet piling
- ☒ other (describe) earthen berm & channel w/riprap lined drop structures

2. Has this levee/floodwall system been certified by a Federal agency to provide protection against the 100-year flood event?

☐ Yes ☒ No

If yes, by which agency? _____

If yes, complete only the interior drainage section on pages 7 and 8 of this form and the operation and maintenance section of Revision Requestor and Community Official Form.

LEVEE/FLOODWALL SYSTEM ELEMENTS (Con'd)

3. Attach certified drawings containing the following information (indicate drawing sheet numbers):

a. Plan of the levee embankment and floodwall structures. Sheet Numbers 2-3

b. A profile of the levee/floodwall system showing the 100-year water surface elevations, levee and/or wall crest and foundation, and closure locations for the total levee system. Sheet Numbers 2-3

c. A profile of the 100-year water surface elevation, closure opening outlet and inlet invert elevations, type and size of opening, and kind of closure device. Sheet Numbers N/A

d. A layout detail for the embankment protection measures. Sheet Numbers N/A

e. Location, layout, and size and shape of the levee embankment features, foundation treatment, floodwall structure, closure structures, and pump stations. Sheet Numbers N/A

FREEBOARD

1. The minimum freeboard provided above the 100-year water surface elevation is:

Riverine

3.0 feet or more at the downstream end and throughout		☐ Yes	☒ No
3.5 feet or more at the upstream end		☐ Yes	☒ No
4.0 feet immediately upstream and downstream of all structures and constrictions	N/A	☐ Yes	☐ No

Coastal

1.0 foot above the height of the one percent wave for the 100-year stillwater surge elevation or maximum wave runup (whichever is greater).	N/A	☐ Yes	☐ No
2.0 feet above 100-year stillwater surge elevation	N/A	☐ Yes	☐ No

Please note, occasionally exceptions are made to the minimum freeboard requirement. If an exception is requested, attach documentation addressing Part 65.10 (b) (1) (ii) of the National Flood Insurance Program regulations. Please see report.

If no is answered to any of the above, please explain where and why: Diversion berm and channel designed by ESI Engineers based on local practice (CCRFCD Manual)

2. Is there an indication from historical records that ice-jamming can effect the 100-year water surface elevation?
☐ Yes ☒ No If yes, provide ice-jam analysis profile and evidence that the minimum freeboard discussed above still exists.

3. Tabulate the elevations at critical locations (tabulate values at each levee crest grade change)

Station	Location	100-Year Water Surface Elevation	(East side) Levee Crest	(East side) Freeboard (ft.)
1+70 (Q=491 cfs)	Upper end berm	2512.9	2514.5	2.1
6+00 (Q=688 cfs)	Added offsite flow	2505.4	2508.5	3.1
12+00 "	Lower end berm	2496.9	2500.0	3.1
13+13 (to 21+00) "	Upper end channel bottom width = 10 ft.	2496.1	2497.2	1.1
21+65 (to 24+50) "	Upper end channel bottom width = 20 ft.	2486.6	2489.0	2.4
26+00 (to 29+00) "	Lower end	2485.2	2485.6	0.4

(Extend table on an added sheet as needed and reference)

SEDIMENT TRANSPORT CONSIDERATIONS

1. A. Is there any indication from historical records that sediment transport (including scour and deposition) can affect the 100-year water surface elevations?

☐ Yes ☒ No

B. Based on the conditions (such as geomorphology, vegetative cover and development of the watershed and stream bed, and bank conditions), is there a potential for debris and sediment transport (including scour and deposition) to affect the 100-year water surface elevations and/or the freeboard for the levee/floodwall?

☐ Yes ☒ No

2. If the answer to either 1A or 1B is yes:

A. What is the estimated sediment (bed material) load?

_____cfs (attach gradation curve)

Explain method used to estimate the sediment transport and the depth of scour and/or deposition

_____

_____

_____

_____

_____

B. Will sediment accumulate anywhere along the levee/floodwall (such as along any bends in the channel)?

☐ Yes ☐ No

If yes, what is the minimum freeboard at these locations?_____feet.

CLOSURES

1. Openings through the levee system:

☐ exist ☒ do not exist

If openings exist, list all closures:

Channel Station	Left or Right Bank	Opening Type	Highest Elevation for Opening Invert	Type of Closure Device

(Extend table on an added sheet as neded and reference)

Geotechnical and geologic data: See ESI Technical Drainage Study

In addition to the required detail analysis reports, data obtained during field and laboratory investigations and used in the design analysis should be submitted in a tabulated summary form for the following levee system features. (Reference U.S. Army Corps of Engineers EM-1110-2-1906 Form 2086).

EMBANKMENT PROTECTION

1. **The maximum levee slope landside is** berm: 2H:1V channel: 2H:1V

2. **The maximum levee slope floodside is** berm: 2H:1V channel: 2H:1V

3. **The range of 100-year riverine flood velocities along the levee?** 3.0 fps **(min.)** to 5.4 fps **(max.)**

4. **Embankment material is protected by (describe the kind):** The earthen berm is not protected. The three drop structures are lined with riprap, bottom and sides, in the channel portion. From Station 21+65 to Station 29+00, the channel sides are lined with riprap beginning at the limits of the caliche layer in the channel bed. Natural caliche layer protects most of the channel bottom and berm flow line.

5. **Riprap Design Parameters: (Include references)** Not known ☐ **Velocity;** ☐ **Tractive stress**
See ESI Technical Drainage Study and drawings.

Reach	Sideslope	Flow depth	Velocity	Curve or Straight	Stone Riprap D_{100}	Stone Riprap D_{50}	Stone Riprap Thickness	Depth of Toedown
Sta_____to_____								
Sta_____to_____								
Sta_____to_____								

(Extend table on an added sheet as needed and reference)

6. **Has a bedding/filter analysis and design been included** ☐ **Yes** ☒ **No**

7. **Describe the analysis for other kinds of protection used** *(include copies of the design analysis)*:

Note: **Attach engineering analysis to support construction plans.**
See ESI Technical Drainage Study.

1. Identify locations and describe the basis for selection of critical locations for analyses: N/A
(Maximum height of berm approximately 3 feet)

☐ Overall height: Sta 1+70 to Sta 12+00 height approx. 3.0 ft.

N/A ☐ Limiting foundation soil strength:

Sta _____, depth _____ to _____

strength Ø = _____ degrees, c = _____ psf

N/A ☐ slope: SS = _____ (h) to _____ (v)

(Repeat as needed on an added sheet for additional slopes and locations)

2. Specify the embankment stability analyses methodology used (e.g. circular arc, sliding block, infinite slope, etc.): N/A - Berm designed by ESI based on engineering judgement.

3. Summary of stability analysis results: N/A

Case	Loading Conditions	Critical Safety Factor	Criteria (Min.)
I	End of construction	_____	1.3
II	Sudden drawdown	_____	1.0
III	Critical flood stage	_____	1.4
IV	Steady seepage at flood stage	_____	1.4
VI	Earthquake (Case I)	_____	1.0

(Reference: U.S. Army Corps of Engineers EM-1110-2-1913 Table 6-1)

4. Was a seepage analysis for the embankment performed? Not known ☐ Yes ☐ No

Describe methodology used: _____

5. Was a seepage analysis for the foundation performed? Not known ☐ Yes ☐ No

Were uplift pressures at the embankment landside toe checked? Not known ☐ Yes ☐ No

Were seepage exit gradients checked for piping potential? Not known ☐ Yes ☐ No

6. The duration of 100-year flood hydrograph against the embankment is 8.33 Hrs.
(Base width of hydrograph)

Note: Attach engineering analysis to support construction plans. See ESI Technical Drainage Study

1. Describe analysis submittal based on Code: N/A

☐ UBC (1988) or ☐ Other (specify)_____

2. Stability analysis submitted provides for: N/A

☐ Overturning; ☐ Sliding; If not, explain_____

_____

3. Loading included in the analyses were: N/A

☐ Lateral earth @ P_A = _____psf; P_p = _____psf

☐ Surcharge--Slope @_____, ☐ surface_____psf

☐ Wind @ P_w = _____psf

☐ Seepage (Uplift) _____ ☐ Earthquake @ P_{eq} = _____%g

☐ 100-year significant wave height_____ft.

☐ 100-year significant wave period_____sec.

4. N/A Summary of Stability Analysis Results: Factors of Safety. Itemize for each range in site layout dimension and loading condition limitation for each respective reach.

Loading Condition	Criteria (Min) Overturn	Criteria (Min) Sliding	Sta_____ To_____ Overturn	Sta_____ To_____ Sliding	Sta_____ To_____ Overturn	Sta_____ To_____ Sliding
Dead & Wind	1.5	1.5				
Dead & Soil	1.5	1.5				
Dead, Soil, Flood & Impact	1.5	1.5				
Dead, Soil & Seismic	1.3	1.3				

(Ref: FEMA 114 Sept 1986; COE EM 1110-2-2502)

(Note: Extend table on an added sheet as needed and reference)

5. Foundation bearing strength for each soil type: N/A

Bearing Pressure	Sustained Load	Short Term Load
Computed design maximum	_____psf	_____psf
Maximum allowable	_____psf	_____psf

6. Foundation scour protection ☐ is, ☒ is not provided, (describe)

N/A

Note: Attach engineering analysis to support construction plans.

SETTLEMENT

1. Anticipated potential settlement has been determined and incorporated into the specified construction elevations to maintain the established freeboard margin.
   ☐ Yes ☒ No
2. The computed range of settlement is N/A ft. to _____ ft.
3. Settlement of the levee crest is determined to be primarily from: N/A
   - ☐ Foundation consolidation
   - ☐ Embankment compression
   - ☐ Other (describe) _____
4. Differential settlement of floodwalls N/A
   ☐ has ☒ has not been accommodated in the structural design and construction.

Note: Attach engineering analysis to support construction plans. N/A

INTERIOR DRAINAGE N/A

1. Specify size of each interior watershed
   - Draining to pressure conduit: N/A
   - Draining to ponding area: N/A
2. Relationships Established
   - Ponding elevation vs. storage: ☐ Yes ☒ No
   - Ponding elevation vs. gravity flow: ☐ Yes ☒ No
   - Differential head vs. gravity flow: ☐ Yes ☒ No
3. The river flow duration curve is enclosed: ☐ Yes ☒ No
4. Specify the discharge capacity of the head pressure conduit: N/A
5. Which Flooding Conditions Were Analyzed?
   - Gravity flow (Interior Watershed): ☐ Yes ☒ No
   - Common storm (River Watershed): ☐ Yes ☒ No
   - Historical ponding probability: ☐ Yes ☒ No
   - Coastal wave overtopping: ☐ Yes ☒ No

   If no, explain why: The Southern Vista Estates Diversion Berm is not a riverine levee system.
6. Interior drainage has been analyzed based on joint probability of interior and exterior flooding and the capacities of pumping and outlet facilities to provide the established level of flood protection.
   ☐ Yes ☒ No

   If no, explain why: The Southern Vista Estates Diversion Berm is not a riverine levee system.
7. The rate of seepage through the levee system for the 100-year flood is N/A cfs

INTERIOR DRAINAGE (Cont'd) N/A

1. The length of levee system used to drive this seepage rate is _____ ft.

9. Will a pumping plant(s) be used for interior drainage? ☐ Yes ☐ No

If yes, include the number of pumping plants: _____

For each pumping plant, list:	Plant #1	Plant #2
The number of pumps		
The ponding storage capacity		
The maximum pumping rate		
The maximum pumping head		
The pumping starting elevation		
The pumping stopping elevation		
Is the discharge facility protected?		
Is there a flood warning plan?		
How much time is available between warning and flooding?		

Will the operations be automatic? ☐ Yes ☐ No

If the pumps are electric, are there backup power sources? ☐ Yes ☐ No

(Reference: U.S. Army Corps of Engineers EM-1110-2-3101, 3102, 3103, 3104, and 3105)

Note: Include a copy of supporting documentation of data and analysis. Provide a map showing the flooded area and maximum ponding elevations for all interior watersheds that result in flooding.

OTHER DESIGN CRITERIA

1. The following items have been addressed as stated:

Liquifaction ☐ is ☒ is not a problem.
Hydrocompaction ☐ is ☒ is not a problem
Heave differential movement due to soils of high shrink/swell ☐ is ☒ is not a problem.

2. For each of these problems, state the basic facts and corrective action taken.

N/A

If the levee/floodwall is new or enlarged, will the structure adversely impact flood levels and/or flow velocities floodside of the structure?

☐ Yes ☒ No

Note: Attach supporting documentation N/A

The planned/installed works are in full compliance with NFIP regulations, Section 44 CFR Ch. 1. 65.10

☐ Yes ☒ No

OPERATIONAL PLAN AND CRITERIA

1. The operation plan incorporates all the provisions for closure devices as required in Section 65.10 (c) (1), of the NFIP regulations N/A

☐ Yes ☐ No

2. The operation plan incorporates all the provisions for interior drainage as required in Section 65.10 (c) (2), of the NFIP regulations N/A

☐ Yes ☐ No

If no to either of the above, please explain.

The Southern Vista Estates Diversion Berm is not a riverine levee system.

FEDERAL EMERGENCY MANAGEMENT AGENCY **DAM FORM**	*O.M.B. Burden No. 3067-0148* *Expires July 31, 1997*	**FEMA USE ONLY**

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 0.5 hour per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. *Send comments regarding the accuracy of the burden estimate and any* suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

Community Name: Clark County, NV

Flooding Source: Flamingo Wash and Red Rock Wash

Project Name/Identifier: Upper Flamingo Wash Detention Basin

IDENTIFIER

Name of Dam: Upper Flamingo Wash Detention Basin Embankment

Location of dam along flood source (in terms of stream distance or cross section identifier):

Stream distance or cross section identifier = N/A. Physical location is SW 1/4, Section 28, T21S, R60E, Mount Diablo Meridian.

Check one of the following:

- ☐ Existing dam
- ☒ New dam
- ☐ *Modifications of existing dam (describe modifications)*

Was the dam designed by _____Federal agency _____State agency

_X_Local government agency _____*Private organization?*

BACKGROUND

Does the dam have dedicated flood control storage? ☒ Yes ☐ No

Does the project involve revised hydrology? ☒ Yes ☐ No

If yes, complete Hydrologic Analysis Form and include calculations of the 100-year inflow flood hydrograph routed through the dam with the beginning pool at the normal pool elevation (spillway crest elevation for ungated spillway). Include any inflow hydrograph bulking by watershed sediment yield and provide necessary debris and sediment yield analysis.

Does the revised hydrology affect the 100-year water-surface elevation behind the dam or downstream of the dam? ☒ Yes ☐ No

If yes, complete the Riverine Hydraulic Analysis Form and complete the table shown on the following page.

Note: Channelization Form (Form 6) completed in lieu of Riverine Hydraulic Analysis Form for downstream analysis.

	Stillwater Elevation Behind the Dam JMM model FIS (see attached)	Revised (see report)
10-year	2458.38	–
50-year	2464.51	–
100-year	2466.85	2471.00
500-year	N/A	N/A
Normal Pool Elevation (empty Reservoir)	2448 ±	2448 ±

Was long term sediment accumulation taken into consideration in determining the normal pool elevation? ☒ Yes ☐ No

Was the dam designed to withstand the hydrostatic and hydrodynamic forces associated with floods greater than the 100-year flood? ☒ Yes ☐ No

If no, and the dam has a reasonable probability of failure during the 100-year flood, please attach dam break analysis.

Provide the following data on the dam:

Dimensional Height: 0' to 38' maximum section
Crest Elevation of top of dam: 2480.0
100-year flood storage capacity: 1056.4 ac-ft
Freeboard (measured from 100-year water surface elevation): 9.0'

Spillway(s):

Type: ☐ gated ☒ ungated

Dimensional Width: 272'
Dimensional Height: 24.5'
Crest Elevation of top of spillway: 2470.50

Outlet(s):

Type: ☐ gated ☒ ungated

Width: 8'-0"
Height 7'-0"
Diameter: N/A
Invert Elevation: 2445.99

Explain flow regulation plan: Uncontrolled - dam function is temporary detention storage. Outlet and spillway discharges are functions of reservoir stage.

Are the project features, including the emergency spillway, designed to accommodate the 100-year flood discharge without overtopping the dam? ☒ Yes ☐ No

Was the dam designed in accordance with all currently applicable local, State, and Federal regulations? ☒ Yes ☐ No

If no, please provide explanation.

FEMA may request a list of regulations that have been complied with and supporting documentation demonstrating compliance with these regulations.

Attach copy of formal operation and maintenance plan – See Form 1 attachment

Answer N/A to any questions which are not applicable

Federal Emergency Management Agency

Washington, D.C. 20472

SEP 27 1995

Mr. Kevin Eubanks, P.E.
Assistant General Manager
Clark County Regional Flood
Control District
301 East Clark Avenue
Suite 301
Las Vegas, Nevada 89101

Dear Mr. Eubanks:

This is in response to your letter dated September 14, 1995, regarding the August 27, 1993, Conditional Letter of Map Revision (CLOMR) to the effective Flood Insurance Rate Map (FIRM) for the unincorporated areas of Clark County, Nevada. In the August 27 CLOMR, we identified the additional information required for us to revise the FIRM to represent the Upper Flamingo Wash Detention Basin (UFWDB) and the proposed diversion channel as providing protection against the flood having a 1-percent chance of being equaled or exceeded in any given year (base flood).

One of the items identified in the CLOMR was an officially adopted maintenance and operation plan for the UFWDB. The CLOMR indicated this plan may be in the form of a written statement from the community Chief Executive Officer, an ordinance, or other legislation and should include information regarding the nature of the maintenance activities, the frequency with which they will be performed, and the title of the local community official who will be responsible for ensuring that the maintenance activities are accomplished. With your letter, you submitted a copy of the Interlocal Contract, Annual Maintenance Program, executed by and between the Clark County Regional Flood Control District (CCRFCD) Board of Directors and Clark County for the current year (Fiscal Year 95/96). The contract states maintenance will be performed in accordance with the CCRFCD Operations and Maintenance Manual. You indicated the UFWDB is included in Item CLA12, Detention Basins, of Exhibit A to the contract, which allocates maintenance funding. You also provided information identifying the Project Manager responsible for the maintenance.

The submitted contract addresses the issue of maintenance of the UFWDB for the current year. Upon receipt of the additional required data, as listed in the CLOMR, we will make a final determination on revising the effective FIRM. If the additional data are provided after the expiration date of the current contract, June 30, 1996, we will require a copy of the contract in effect at the time the data are submitted.

If you have any questions regarding this matter, please contact Mr. John Magnotti of our staff in Washington, DC, either by telephone at (202) 646-3932 or by facsimile at (202) 646-4596.

Sincerely,

Michael K. Buckley, P.E., Chief
Hazard Identification Branch
Mitigation Directorate

Upper Flamingo Wash Detention Basin CLOMR
Case No.: 93-09-407R

Dear Mr. Locke:

This letter is written in response to the Conditional Letter of Map Revision (CLOMR) dated August 27,1993, for the above-referenced case. A condition of the CLOMR is submittal of a maintenance and operation plan for the Upper Flamingo Wash Detention Basin (UFWDB). The following is offered to address that condition.

The Clark County Regional Flood Control District (CCRFCD) has established a master plan of facilities to control stormwater runoff within Clark County. Projects identified within the master plan are eligible for maintenance funding provided by the CCRFCD. The UFWDB is included on the master plan and has its maintenance and operation funded by the CCRFCD.

The various governmental entities within Clark County take the lead in procuring and expending CCRFCD funds for design, right-of-way acquisition, construction, and maintenance and operation of the facilities included on the master plan. Each project "belongs" to the individual entity who owns the rights-of-way on which they are constructed. Maintenance work plans and interlocal funding contracts are developed annually by each entity in support of their request to the CCRFCD Board of Directors for maintenance and operation funds.

Enclosed please find a copy of the Interlocal Contract, Annual Maintenance Program executed by the CCRFCD Board of Directors for the current year (FY 95/96) for Clark County. Exhibit A, Page 3, Item CLA12 of the County's contract provides maintenance funding for detention basins which includes the UFWDB.

301 E. Clark Avenue, Suite 301 • Las Vegas, Nevada 89101
(702) 455-3139 • FAX: (702) 455-3870

I hope this information adequately addresses the issue of continued maintenance of this important flood control facility. A copy of this letter will be included in a package of technical data to be submitted at a later date which addresses the remaining conditions stated in the subject CLOMR. If I can be of any further assistance, please call.

Sincerely,

Kevin Eubanks, P.E.
Assistant General Manager

BACKGROUND:

In August, 1992 a drainage study titled Hydrology Study for Southern Vista Estates Condominiums, CCPW PN # 92-08-10-01 ZC # 27-91, was prepared by this firm and submitted to Clark County Public Works for review. The objective of that report was to identify the offsite drainage area that impacts the Southern Vista Estates 15 acre condominium site. The study quantified the amount of storm water that would be generated within the offsite basin during a 10 and 100 year design storm. Also presented in the report was a proposal to construct an open channel that would intercept the offsite storm water and convey it North past the condominium site, discharging into the Upper Flamingo Detention Basin outfall channel. The proposed channel was to be constructed along the Western property boundary of Southern Vista Estates, within Clark County right of way, and would have extended approximately 660 feet South of the Southwest corner of the project and 1000 feet North of the Northwest corner of the project to the existing outfall channel.

In September, 1992 a set of channel improvement plans and a supporting hydraulic analysis were submitted to the County for review. ESI received the initial set of review comments from Willdan and Associates in early October. Since that time the channel alignment proposed in the August submittal has been abandoned.

On October 8, 1992 a meeting was held at Clark County Public Works to discuss an alternate channel alignment, present at the meeting were Dan Wonders and Tom Davy of ESI, the developer Max Morgan and Robert Thompson of Clark County Public Works. The alternate alignment would also intercept the storm water generated within the basin discussed in the August study, but would discharge into the detention basin rather than the outfall channel. Neither CCPW or CCRFCD had any objections to the proposed alignment discussed in the meeting.

The purpose of this submittal is to provide the County with a revised analysis for the new channel alignment.

GENERAL:

Project location:

The location of the proposed diversion channel lies along the Western 50 feet of the East Half (E 1/2) of the East Half (E 1/2) of the Southeast Quarter (SE 1/4) of the Northwest Quarter (NW 1/4) and the East Half (E 1/2) of the Southeast Quarter (SE 1/4) of the Northeast (NE 1/4) of the Northwest Quarter (NW 1/4) of Section 33, Township 21 South, Range 60 East, M.D.B.& M., Clark County, Nevada. The channel is to be constructed within a portion of three-five acre BLM parcels and one five acre private parcel. Acquisition of the necessary easements from both the BLM and the private land owner are currently ongoing. See exhibits 1 and 2 for the vicinity map and land ownership exhibit.

Flood Hazard Zone:

A review of Flood Insurance Rate Map, Community Panel 320003 1211-B, effective date: September 29, 1989, indicates that the proposed channel lies in an area which has been classified as Zone X, an area determined to be outside the 500-year flood plain. See exhibit 3 for the project delineation on the Flood Map.

Regional Flood Control Facilities:

Refer to exhibit 4 for the location of the project site relative to regional facilities. The channel is proposed to discharge into the Upper Flamingo Detention Basin. An analysis which assess the impacts of the channel on the detention basin is included within the body of this report.

Project Description:

The proposed improvements include approximately 2000 feet of temporary open channel/earth berm which will convey storm water from the confluence of two existing washes, near Patrick Lane and the intersection of the channel alignment, North to the Upper Flamingo Detention Basin.

The collection system at the Southern end of the project consists of an earth berm that diverts storm water from the existing wash and directs it into the upstream end of the channel. Since the improvements are intended to be temporary, an earth berm will only be provided on the East bank of the channel. Fully riprap lined, sloping drop structures are proposed at several locations to make up the grade differential between existing ground and the channel flow line. The drop structures also aid in keeping the invert of the channel above a caliche layer which has been determined to be within five feet of the surface. The slope of the channel is maintained at a rate of four tenths percent to keep flow velocities at a minimum. Rip rap protection is also being proposed at the outlet of the channel into the detention basin.

The channel alignment abuts a private parcel of land along its Western boundary for the Northern most 660 feet of channel. To prevent inundation of this parcel from water contained within the channel, it will be necessary to construct an earth berm along the Western bank of the channel for a portion of this frontage. Since the improvements are of a temporary nature a single 12 foot access road is being proposed for construction along the East side of the channel. The berm/access road is proposed to tie into the existing detention basin access road at the Southeast corner of the detention basin and has been detailed on the channel improvement plans.

METHODOLOGY:

In order to estimate peak runoff values from drainage basins that discharge toward the project site, the HEC-1 Flood Hydrograph package developed by the Army Corps of Engineers Hydrologic Engineering Center was used to model a 6-hour, 100-year storm event. Infiltration rates were developed using the Soil Conservation Service (SCS) Soil Survey of the Las Vegas Valley Area. Curve numbers are based on weighted averages of each soil unit and on the percent composition of each soil unit within the drainage area (see exhibits 5, 6, & 7).

The HEC2 Water Surface Profile model was used to ascertain water surface elevations for both pre and post development conditions.

OFFSITE DRAINAGE ANALYSIS:

The offsite basin delineated on exhibit 8 is the area that was modeled to determine the 100 year design flow for the channel. The offsite basin is a portion of the offsite basin delineated on exhibit 10 of the previously submitted Hydrology Study for Southern Vista Estates. The revised basin takes into account an additional 24 acres in the extreme Northwest portion of the basin but is decreased roughly 76 acres in the Northeast portion. Hydrologic parameters for the revised basin were derived from four hundred scale topographic maps similar to the four hundred scale map provided to Willdan and Associates for reference to the Southern Vista Estates Study. Time of concentration calcs can be found in appendix A for subbasins OFF1 through OFF5. The input and output HEC1 files for the revised basin are also located in appendix A. Results from the HEC1 model indicate that a total offsite flow rate of 688 cfs will impact the channel.

Exhibit 9 depicts the channel alignment, on a 400 scale topographic map, relative to the revised offsite basins.

HEC2 ANALYSIS:

Pre-Development:

Appendix B contains the predevelopment HEC2 runs upstream of Patrick Lane. Each wash was modeled separately from the confluence of the tributaries, upstream approximately 600 feet. Exhibit 10 shows the locations of the HEC2 cross sections for both the Southeast and Southwest tributary. Both super and sub-critical flow regimes were run. The results indicate that under existing conditions the 100 year flow within both tributaries tends to flow at critical depth. The flow remains within the tributary banks. Upon convergence of the tributaries at Patrick Lane the resulting wash travels to the East of the Project alignment and did not require modeling North of Patrick Lane.

Post-Development:

Super and subcritical HEC2 runs for the developed condition are contained in Appendix C. The cross section stationing used within the HEC2 models can be referenced directly from the improvement plans for the Southern Vista Estates Temporary Channel. Cross sections used within the HEC2 model at the transition of the existing wash to the proposed channel, at the South end of the project, have also been incorporated within the models. Results of the models indicate that the flow regime remains subcritical for all portions of the channel accept the drop structures, the expansion at station 21+00, and at the terminus of the channel at the detention basin, station 28+00. At these locations the flow regime is super critical

Migration of the existing tributaries, North of the confluence point, is not expected to be significant due to the incision of the existing thalweg.

Erosion Protection:

A geotechnical study of the channel alignment was performed by Geotechnical & Environmental Services, Inc., the results of which are contained in appendix D. The geotechnical report indicates that a erosion resistant caliche layer underlies the channel alignment at a depth of roughly five to six and one half feet. The invert of the channel is maintained at or above this layer unless the results of the borings allow otherwise.

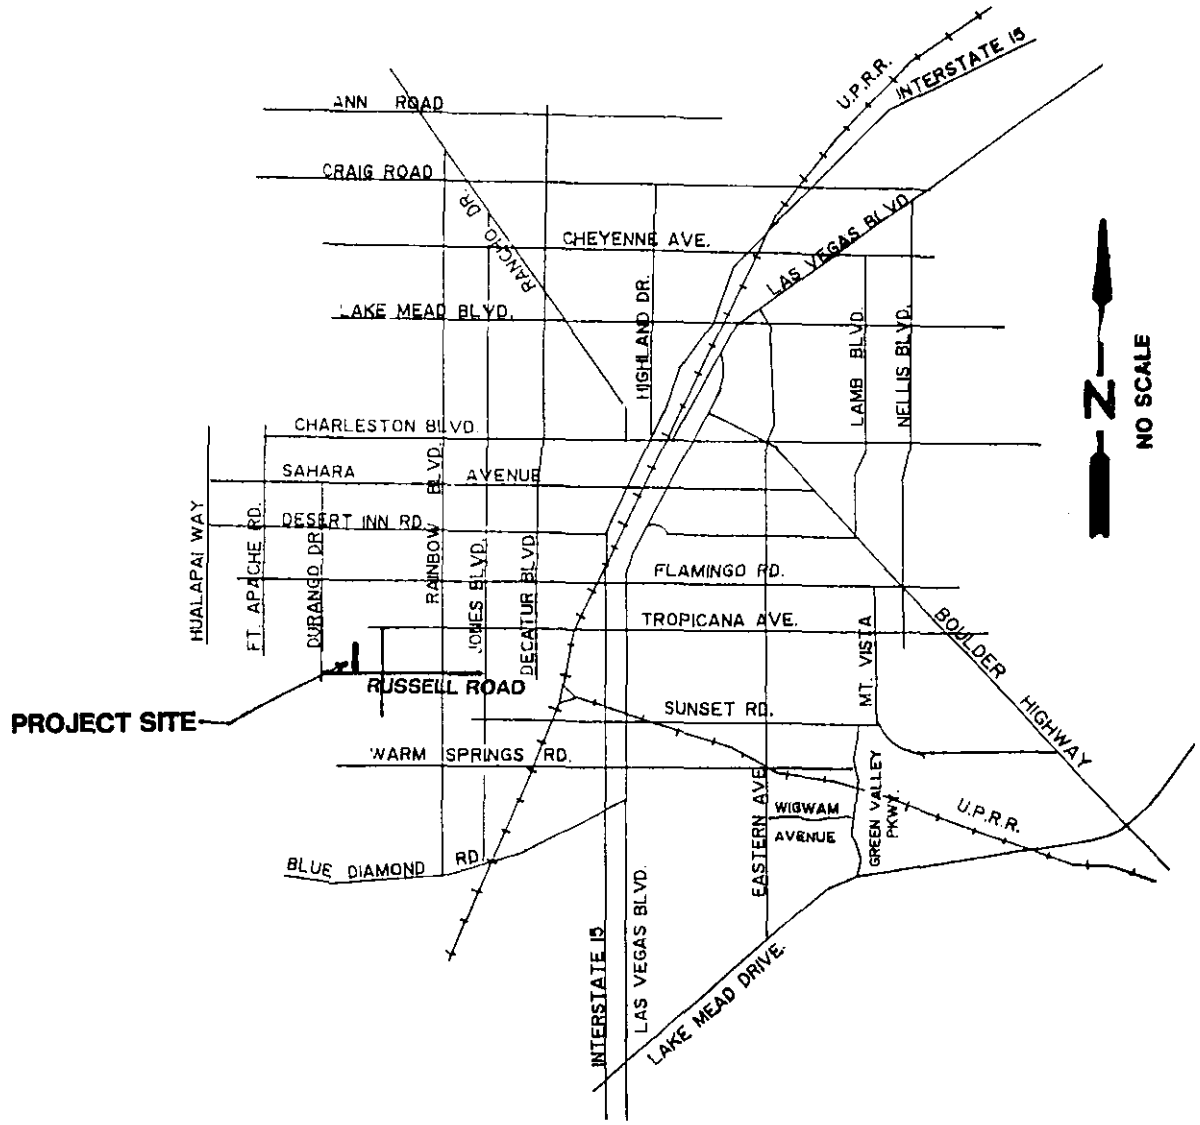
Riprap protection is proposed for the entire East bank of the channel, the drop structures and the outlet into the detention basin. Riprap sizing calculations are also provided in appendix D. The riprap protection along the East bank is proposed to extend to a minimum depth of three feet at the toe of the bank, or to the first caliche layer. The drop structures are proposed to be fully riprap lined. Riprap erosion protection is also being proposed for the bottom and East bank of the channel outlet at the detention basin.

Freeboard Protection:

Freeboard calculations are provided for all of the unique sections of channel and are listed in appendix E. The required amount of freeboard has been provided for on the East side of the channel.

Water Surface Profile:

The water surface profile for the entire channel length has been plotted on the profile portion of the channel improvement plans.



Impacts on Upper Flamingo Detention Basin:

The existing impoundment area of the Upper Flamingo Detention Basin for the 100 year 6 hour storm has a surface area of 89.5 acres, a ponding elevation of 2469.6 and a total detained volume of 880 acre feet, reference Upper Flamingo Detention Basin and Discharge Channel, by Black & Veatch Engineers, June, 1989. A total additional volume of 63 acre feet will be diverted into the detention basin with the development of the Southern Vista Channel (reference the HEC1 output files in appendix A).

The effects of this increase will be negligible on the the capacity of the basin. Exhibit 11 shows the relative differences in ponding elevation and area versus storage. The post development ponding elevation is expected to increase roughly seven tenths of a foot to an elevation of 2470.3, the total detained volume will increase to 943 acre feet. The addition of 63 acre feet to the basin will have a negligible effect on the surface area within the basin.

CONCLUSION

This study will comply with the CCRFCD Criteria Standards. A copy of this study and all subsequent addenda will be provided to Clark County Regional Flood Control upon approval by the County.

Re: Soils Exploration at Proposed Southern Vista Channel Site, Clark County, Nevada.

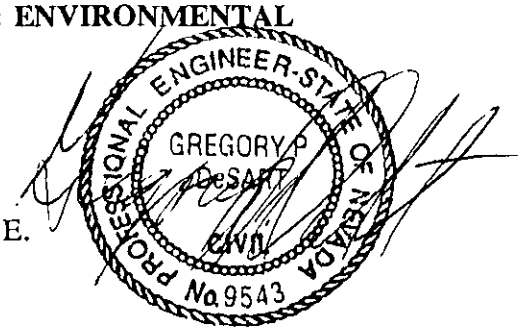
Dear Mr. Morgan:

At your authorization, Geotechnical & Environmental Services, Inc. (GES, Inc.) has performed soils exploration along the proposed alignment of the Southern Vista Channel to evaluate soils and subsurface conditions as related to a scour analysis. The information obtained from this evaluation will be utilized by Engineers & Surveyors, Inc. for their soil scour evaluation of the channel. It is our understanding that the pertinent information which is needed is a grain size distribution and the depth to caliche or cemented soils. The grain size diameter at which 90 percent and 50 percent passes (D_{90} and D_{50}, respectively) is necessary for the soil scour modelling analysis.

The section of the proposed Southern Vista Channel which is being evaluated is located in Clark County, Nevada in Section 33, T21S, R60E on the south end of an existing Detention Basin and extends from approximately 672 feet south of the intersection of the alignments of Russell Road and Cimarron Road at the Southern tip of the detention basin dam to the south approximately 2,000 feet up the proposed channel alignment. Plate 1, enclosed, shows the proposed location of the channel in relation to the surrounding area.

Field exploration was performed by drilling four borings at the locations shown on Plate 1 utilizing a Mayhew 600 air rotary drill rig. Due to the presence of cemented sand and gravel deposits, it was not possible to perform backhoe excavations to obtain representative composite soil samples for sieve analysis testing.
The subsurface explorations were performed under the direction and supervision of a GES, Inc. representative who visually inspected the site, maintained detailed logs of the subsurface conditions, identified the depths of cemented caliche deposits, and classified the soils encountered. The soils encountered were classified in the field through observation of drill cuttings.

The subsurface conditions are relatively consistent at the site. Generally, a loose surface layer of sandy silty gravel overlies layers of very hard and strongly cemented sand and gravel caliche interbedded with medium dense to dense non-cemented sand and gravel. A relatively consistent layer of cemented sand and gravel caliche was encountered at a depth of 5 to 6 1/2 feet with an average thickness of approximately 2 feet. Figure 2 shows a soil profile indicating the relative locations of the borings and the depths and thicknesses of subsurface layers encountered.



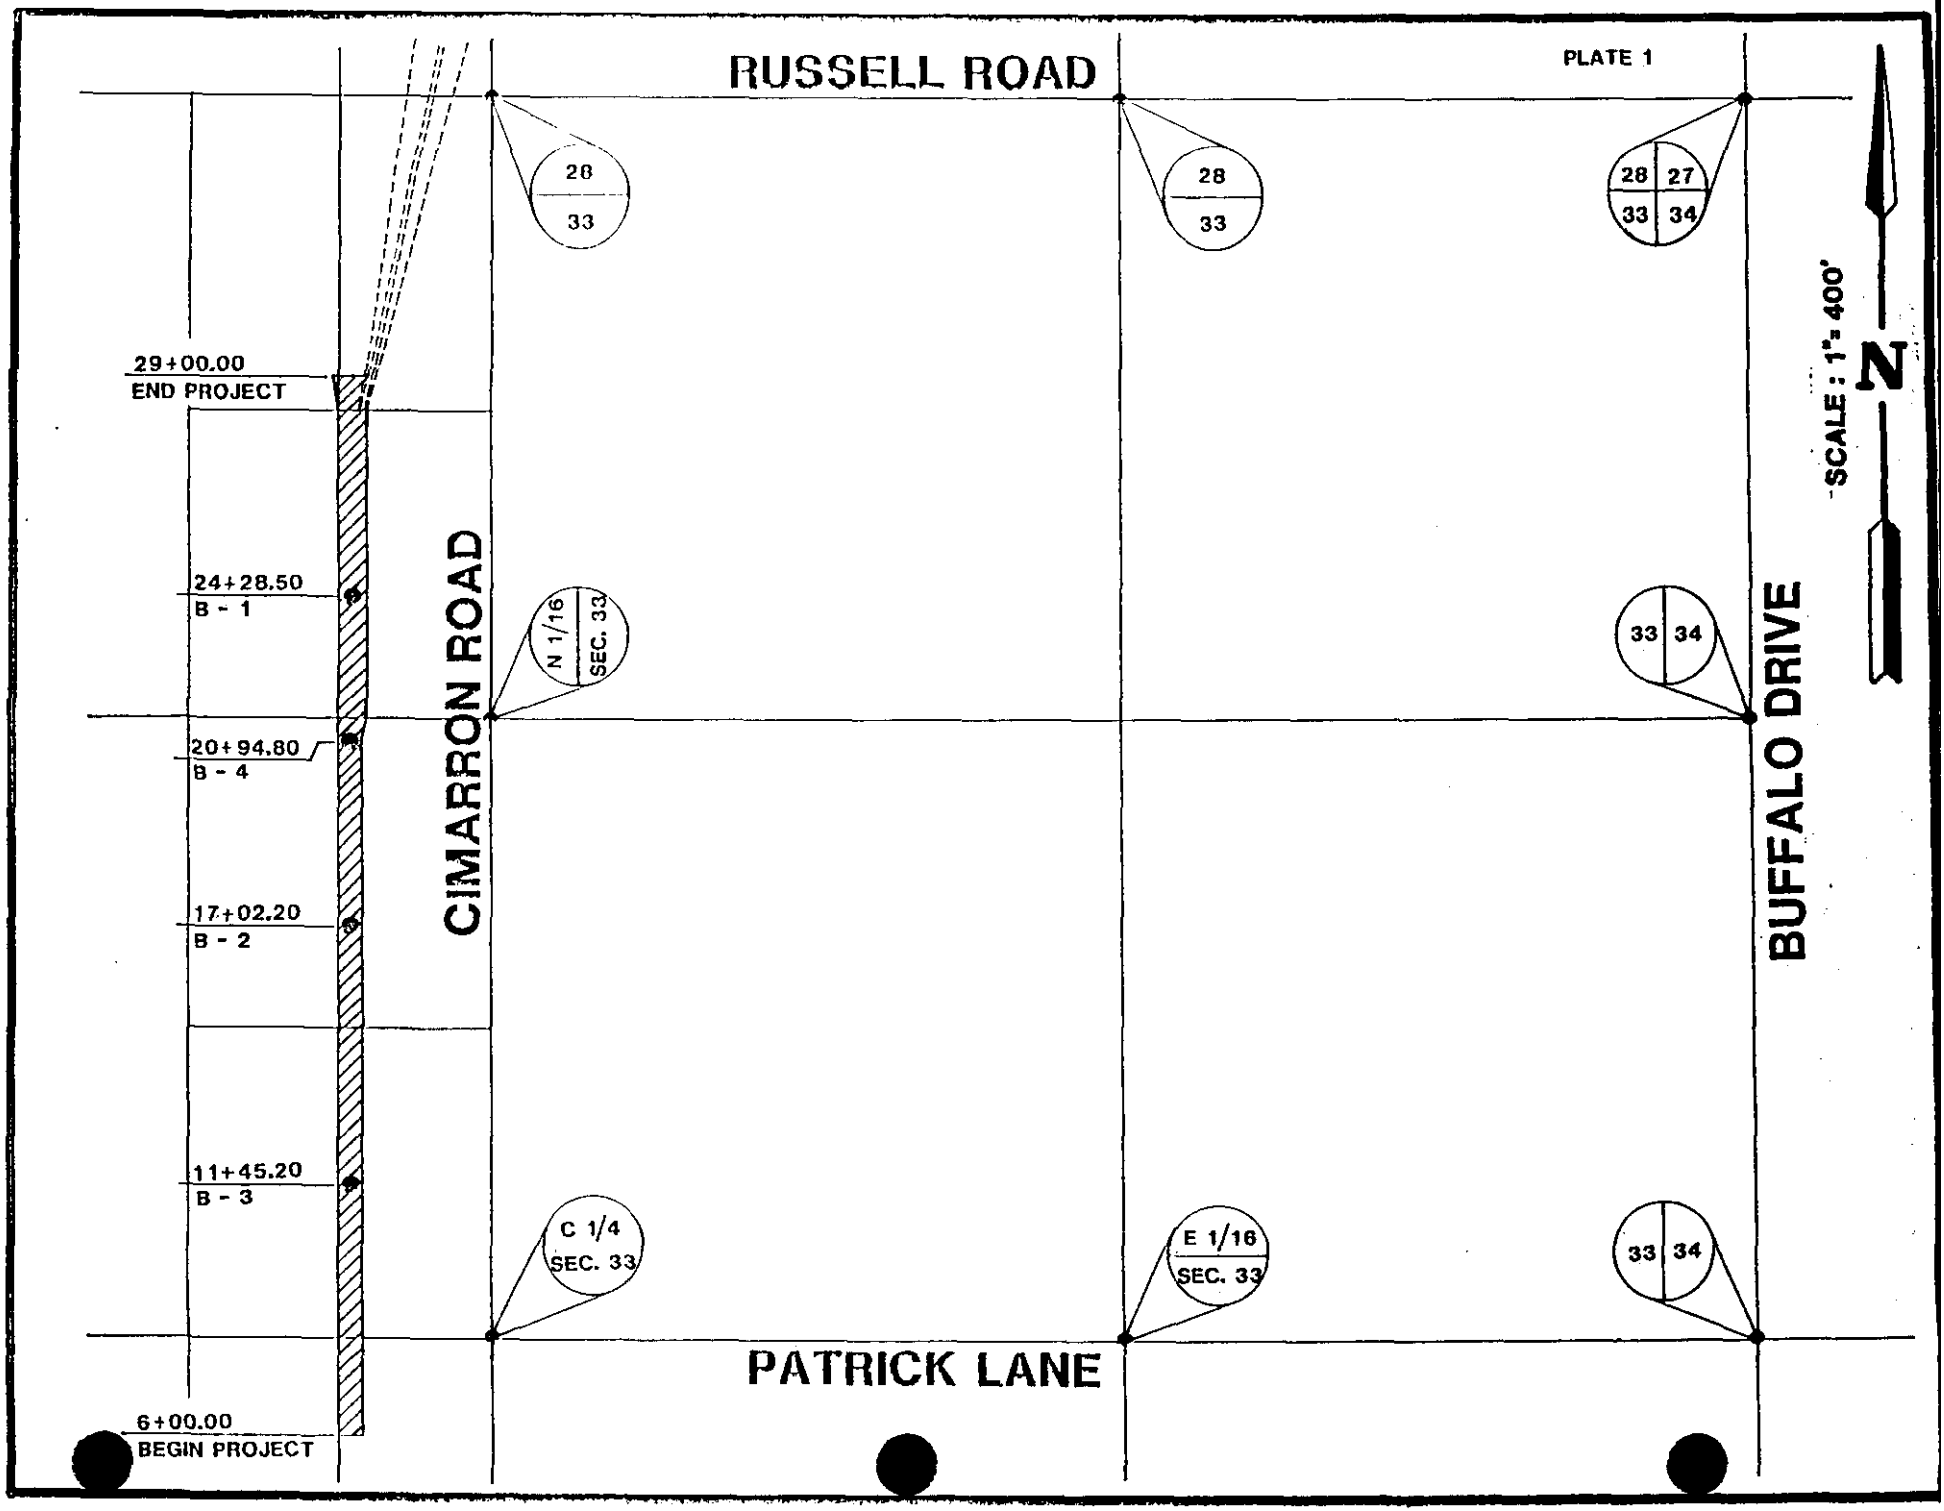
Based upon the results of our field exploration, we feel that soil scour will not occur below strongly cemented sand and gravel layers greater than 1 foot in thickness. For the scour evaluation, we recommend a D_{90} of 20 mm and a D_{50} of 5 mm. These recommended grain sizes are conservative estimates based upon the type of soils classified by the cuttings observed during drilling.

Based upon this information, we recommend that the bottom of the channel be no more than 5 feet below existing site grade. This is intended to limit soil scour to a depth of approximately 2 feet or to the top of the lowest caliche layer encountered during our exploration, whichever is less.

We appreciate this opportunity to provide our services. If you have any questions or comments, please do not hesitate to contact our office.

Sincerely,

GEOTECHNICAL & ENVIRONMENTAL SERVICES, INC.



Gregory P. DeSart, P.E.
General Manager

ATTN: Mr. Robert Thompson

RE: Technical Drainage Study for the Southern Vista
Temporary Drainage Channel

Dear Mr. Thompson:

The following is a response to the memorandum, from Willdan and Associates, dated November 12, 1992 regarding comments to the above referenced drainage study.

Comment 1. It appears that the proposed channel berm will not divert the entire 491 cfs from basin OFF3 as shown on Exhibit 9. A field investigation and review of existing topo shows that extending the proposed channel/berm south will enable the entire 491 cfs to be diverted north along the proposed channel berm.

Response. The berm, as shown on the improvement plans, on the East bank of the channel has been extended roughly 400 feet to the South to assure that the entire 491 cfs is intercepted.

7018 W. CHARLESTON BLVD • LAS VEGAS, NEVADA 89117 • (702) 363-6415 FAX 363-4142

Comment 2. The HEC2 models, which appear to correctly analyze the proposed project, indicate that the entire stretch of channel/berm is flowing at an erosive velocity. While the entire channel bottom will be protected by the caliche from excessive scour, the channel side slopes will not be protected. As indicated in the Clark County Regional Flood Control District's Hydrologic Criteria and Drainage Design Manual, Table 702 "Maximum Permissible Mean Channel Velocities," the channel side slopes must be protected as indicated with grouted riprap for velocities over 10-feet-per-second, and loose riprap for velocities under 10-feet-per-second.

Response. Loose riprap protection will be provided along both banks of the channel for the entire length with the exception of the drop structures. The drop structures will be grouted riprap.

Comment 3. An analysis of the deposition and erosive impact for the point at which the southeast and southwest tributaries combine, has not been included.

Response. As per our meeting on November 19, 1992 at Willdan and Associates. The issue of erosion analysis at the confluence of the tributaries was resolved.

Comment 4. The impact on the existing upper Flamingo Detention Basin outlet flows must be analyzed to determine if any adverse impact will occur due to the additional detention basin depth.

Response. Exhibit 1 is an analysis of the Upper Flamingo Detention Basin outfall. An increase of 21 cfs is expected to be contributed to the outfall channel. The increase to the outfall channel will have a negligible effect on the outfall channel. The increase to the water surface elevation within the basin does not breach the spillway weir.

Comment 5. At the request of Clark County Public Works, Grading Plans for the proposed development have been reviewed for compliance to permitting requirements according to section 34.030 of the "Uniform Regulations for the Control of Drainage," revised November 12, 1990. The plans submitted do not meet the minimum requirements and must be revised prior to Drainage Study approval, to address the following.

a. Legal description of project location.
b. Abbreviations
c. The following note must be added to all grading plans. All work performed within public right of way and outside of the project boundary shall be performed under a separate encroachment permit issued by the controlling authority.

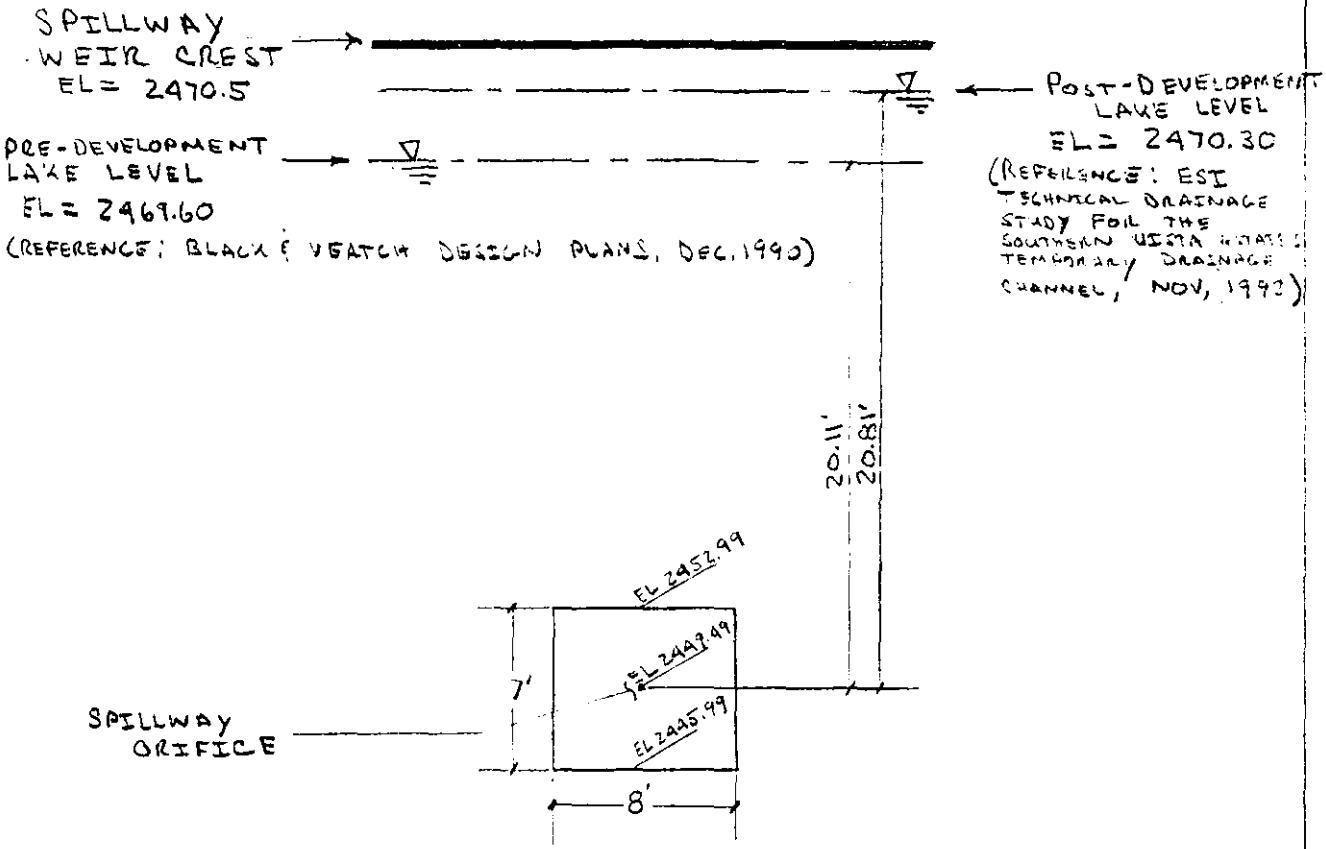
Response. The above requirements have been added to the grading plan.

Comment 6. A copy of this memo is being submitted to Clark County Regional Flood Control District at their request. As a condition of final approval, the applicant must submit this study and all addenda to Clark County Regional Flood Control District for concurrence.

Response. Upon approval of this study by Clark County a copy of the original study and all subsequent addenda will be submitted to CCRFCD for concurrence.

This concludes my response to the comments. If you should have any questions regarding these comments please contact me.

Sincerely,



Thomas E. Davy

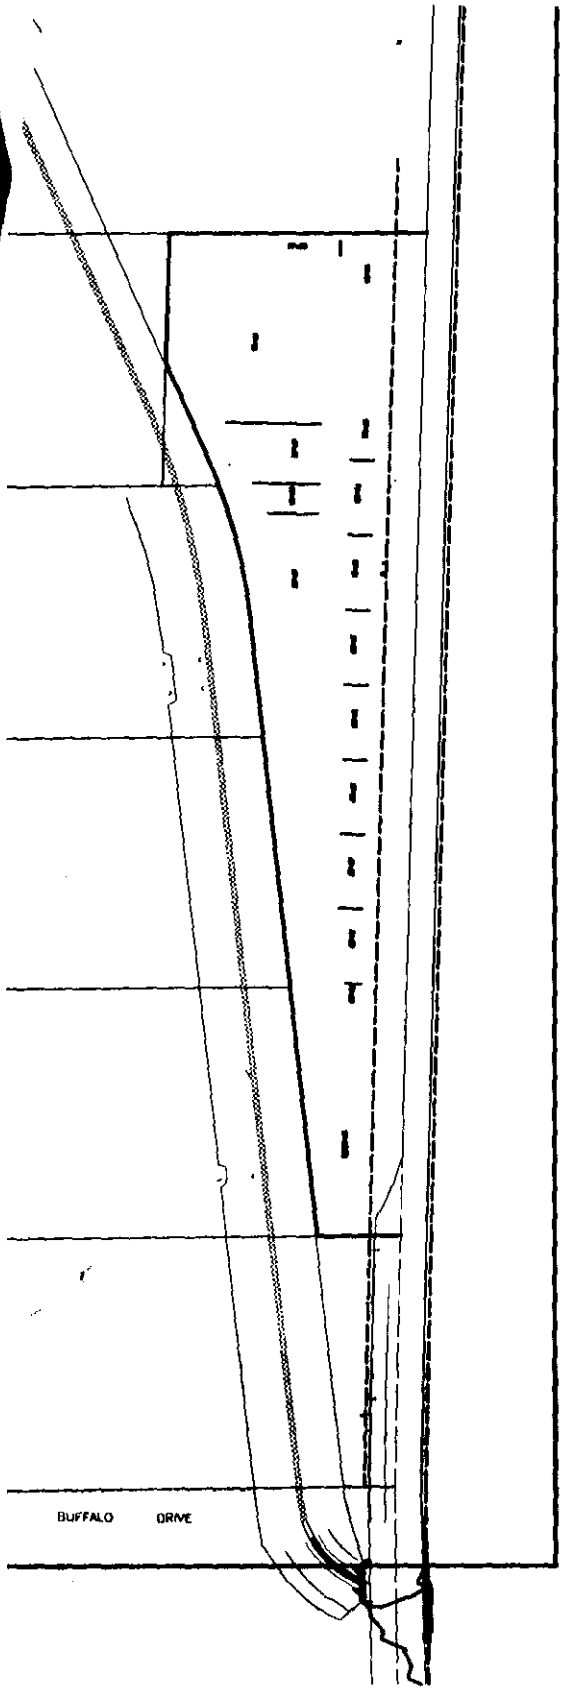
RE: Flamingo Wash Diversion Channel

Dear Mr. Eubanks,

This letter is to certify that the Flamingo Wash Diversion Channel is in place, and appears to have been constructed in conformance with the approved channel improvement plans entitled, *"Improvement Plans of Southern Vista Estates, Drainage Channel,"* completed by Engineers and Surveyors, Inc., February 1993.



A recent field investigation was completed to certify the channel's location, cross sectional geometry and plan elevations. Depth of rip rap was unable to be verified. Soil borings were completed on the project prior to construction. These soil borings revealed a caliche layer was encountered three to six feet below the surface.

If you have any questions or comments regarding this project, please call me at (702) 248-6415.

Sincerely,
Engineers and Surveyors, Inc.

LEGEND

SPECIAL FLOOD HAZARD AREAS INUNDATED BY 100-YEAR FLOOD

- ZONE A — No base flood elevations determined.
- ZONE AE — Base flood elevations determined.
- ZONE AH — Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
- ZONE AO — Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined; for areas of alluvial fan flooding, velocities also determined.
- ZONE A99 — To be protected from 100-year flood by Federal flood protection system under construction; no base flood elevations determined.
- ZONE V — Coastal flood with velocity hazard (wave action); no base flood elevations determined.
- ZONE VE — Coastal flood with velocity hazard (wave action); base flood elevations determined.

FLOODWAY AREAS IN ZONE AE

OTHER FLOOD AREAS

- ZONE X — Areas of 500-year flood; areas of 100-year flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 100-year flood.

OTHER AREAS

- ZONE X — Areas determined to be outside 500-year floodplain.
- ZONE D — Areas in which flood hazards are undetermined.

UNDEVELOPED COASTAL BARRIERS

Identified 1983 | Identified 1990 | Otherwise Protected Areas

Coastal barrier areas are normally located within or adjacent to Special Flood Hazard Areas.

- Flood Boundary
- Floodway Boundary
- Zone D Boundary
- Boundary Dividing Special Flood Hazard Zones, and Boundary Dividing Areas of Different Coastal Base Flood Elevations Within Special Flood Hazard Zones.

- (D) (D) — Cross Section Line
- (EL 987) — Base Flood Elevation in Feet Where Uniform Within Zone. See Map Index for Elevation Datum.
- RM7 × — Elevation Reference Mark
- M2 — River Mile
- 97°07'30", 32°22'30" — Horizontal Coordinates Based on North American Datum of 1927 (NAD 27) Projection.

NOTES

This map is for use in administering the National Flood Insurance Program; it does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size, or all planimetric features outside Special Flood Hazard Areas.

Coastal base flood elevations apply only landward of 0.0 NGVD, and include the effects of wave action; these elevations may also differ significantly from those developed by the National Weather Service for hurricane evacuation planning.

Areas of Special Flood Hazard (100-year flood) include Zones A, AE, AH, AO, A99, V, and VE.

Certain areas not in Special Flood Hazard Areas may be protected by flood control structures.

Boundaries of the floodways were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the Federal Emergency Management Agency.

Floodway widths in some areas may be too narrow to show to scale. Floodway widths are provided in the Flood Insurance Study Report.

This map may incorporate approximate boundaries of Coastal Barrier Resource System Units and /or Otherwise Protected Areas established under the Coastal Barrier Improvement Act of 1990 (PL 101-591).

Corporate limits shown are current as of the date of this map. The user should contact appropriate community officials to determine if corporate limits have changed subsequent to the issuance of this map.

For community map revision history prior to countywide mapping, see Section 6.0 of the Flood Insurance Study Report.

For adjoining map panels and base map source see separately printed Map Index.

          This  is a split flow analysis to determine weir flows over UPRR
          and flows thru UPRR and I-15 underpasses.  HEC-2 coding taker from
          input file supplied by COE (LVWFWRRW).  After split flows were
          calculated, Q's put back in regular R2 run.

          WEIR FLOW OVER HEAVY RAILS INCLUDED FOR UPRR WEIR CONDITIONS
          X-7.92 AND X-8.02 HAD 1 FT ADDED FOR AGREEMENT BETWEEN '74 AND '84 TOPO
          STARTED AT SLOPE = .0001 AS SUGGESTED IN WRITTEN COMMENTS
             Subsequent results submitted by COE showed difference in flow
             split at Spring Mtn Rd; JM4 not given input data.  Final COE
             results have 0/670/1730/3030 flowing east thru Spring Mtn Rd
```

This is a split flow analysis to determine weir flows over UPRR and flows thru UPRR and I-15 underpasses. HEC-2 coding taken from input file supplied by COE (LVWFWRRW). After split flows were calculated, Q's put back in regular R2 run.

WEIR FLOW OVER HEAVY RAILS INCLUDED FOR UPRR WEIR CONDITIONS
X-7.92 AND X-8.02 HAD 1 FT ADDED FOR AGREEMENT BETWEEN *74 AND *84 TOPO
STARTED AT SLOPE = .0001 AS SUGGESTED IN WRITTEN COMMENTS
Subsequent results submitted by COE showed difference in flow split at Spring Mtn Rd; JMM not given input data. Final COE results have 0/670/1730/3030 flowing east thru Spring Mtn Rd opening and 0/860/2080/3580 cfs flowing north over Spring Mtn Rd. Rest of run is ok.

This is a split flow analysis to determine weir flows over UPRR and flows thru UPRR and I-15 underpasses. HEC-2 coding taker from input file supplied by COE (LVWFWRRW). After split flows were calculated, 0*s put back in regular R2 run.

WEIR FLOW OVER HEAVY RAILS INCLUDED FOR UPRR WEIR CONDITIONS
X-7.92 AND X-8.02 HAD 1 FT ADDED FOR AGREEMENT BETWEEN *74 AND *84 TOPO

STARTED AT SLOPE = .0001 AS SUGGESTED IN WRITTEN COMMENTS
Subsequent results submitted by COE showed difference in flow split at Spring Mtn Rd; JMM not given input data. Final COE results have 0/670/1730/3030 flowing east thru Spring Mtn Rd opening and 0/860/2080/3580 cfs flowing north over Spring Mtn Rd. Rest of run is ok.

This is a split flow analysis to determine weir flows over UPRR and flows thru UPRR and I-15 underpasses. HEC-2 coding taken from input file supplied by COE (LVWFWRRW). After split flows were calculated, Q's put back in regular R2 run.

WEIR FLOW OVER HEAVY RAILS INCLUDED FOR UPRR WEIR CONDITIONS
X-7.92 AND X-8.02 HAD 1 FT ADDED FOR AGREEMENT BETWEEN '74 AND '84 TOPO
STARTED AT SLOPE = .0001 AS SUGGESTED IN WRITTEN COMMENTS
Subsequent results submitted by COE showed difference in flow split at Spring Mtn Rd; JMM not given input data. Final COE results have 0/670/1730/3030 flowing east thru Spring Mtn Rd opening and 0/860/2080/3580 cfs flowing north over Spring Mtn Rd.
Rest of run is ok.

         This  is a split flow analysis to determine weir flows over UPRR
         and flows thru UPRR and I-15 underpasses.  HEC-2 coding taken from
         input file supplied by COE (LVWFWRRW).  After split flows were
         calculated, Q's put back in regular R2 run.

         WEIR FLOW OVER HEAVY RAILS INCLUDED FOR UPRR WEIR CONDITIONS
         X-7.92 AND X-8.02 HAD 1 FT ADDED FOR AGREEMENT BETWEEN '74 AND '84 TOPO
         STARTED AT SLOPE = .0001 AS SUGGESTED IN WRITTEN COMMENTS
            Subsequent results submitted by COE showed difference in flow
            split at Spring Mtn Rd: JMM not given input data.  Final COE
            results have 0/670/1730/3030 flowing east thru Spring Mtn Rd
            opening and 0/860/2080/3583 cfs flowing north over Spring Mtn Rd.
            Rest of run is ok.

                                PARADISE ROAD                                  ####
            ####  This is a swale crossing with minor drains for low flow      ####
            ####  Debris is assumed to block drains.  This crossing has        ####
            ####  been modeled as a regular ground section.  Q500 reduced      ####
            ####  due to breakout over Flamingo Rd (separate split flow run)   ####
