THIS IS A SWALE CROSSING WITH MINOR DRAINS FOR LOW FLOW
DEBRIS IS ASSUMED TO BLOCK DRAINS. THIS CROSSING HAS
BEEN MODELED AS A REGULAR GROUND SECTION. Q500 REDUCED
DUE TO BREAKOUT OVER FLAMINGO RI (SEPARATE SPLIT FLOW RUN)

3301 HV CHANGED MORE THAN HVINS

Centerline = 2330
Small Golf Course Bridge not modeled - assumed to fail
Some of breakout returns from north; modeled flows do
not change because flows from Tropicana Wash confluence
still control.

Centerline = 2380 #### Small Golf Course Bridge not modeled - assumed to fail ####
Some of breakout returns from north; modeled flows do
not change because flows from Tropicana Wash confluence
still control.

7.92 This  is a split flow analysis to determine weir flows over UPRR
7.92 and flows thru UPRR and I-15 underpasses.  HEC-2 coding taken from
7.92 input file supplied by COE (LVWFWRRW).  After split flows were
7.92 calculated, Q's put back in regular R2 run.
7.92
7.92 WEIR FLOW OVER HEAVY RAILS INCLUDED FOR UPRR WEIR CONDITIONS
7.92 X-7.92 AND X-8.02 HAD 1 FT ADDED FOR AGREEMENT BETWEEN '74 AND '84 TOPO
7.92 STARTED AT SLOPE = .0001 AS SUGGESTED IN WRITTEN COMMENTS
7.92     Subsequent results submitted by COE showed difference in flow
7.92     split at Spring Mtn Rd; JMM not given input data.  final COE
7.92     results have 0/670/1730/3030 flowing east thru Spring Mtn Rd
7.92     opening and 0/860/2080/3580 cfs flowing north over Spring Mtn Rd.
7.92     Rest of run is ok.
8.23 U/S SIDE OF UPRR UNDERPASS BELOW I-15; WEST SIDE ABUTMENT
8.24 D/S SIDE OF UPRR UNDERPASS BELOW I-15; EAST SIDE ABUTMENT
8.66 D/S ABUTMENT UPRR BRIDGE; HIGH CHANNEL CODED WITH DIVERTER LEVEE
```

Attention: Mr. Dana Reel, P.E.

Subject: Geotechnical Investigation
Proposed Flamingo Wash Detention Basin
Clark County, Nevada
Kleinfelder Project No. 128106

Dear Mr. Reel:

Enclosed please find our geotechnical investigation for the proposed Flamingo Wash Detention Basin in Clark County, Nevada.

The soil conditions revealed in our investigation appeared to be relatively consistent between the locations explored. Generally, very dense sands and gravels with numerous layers of calcareous cemented soils were encountered.

The enclosed report details our field and laboratory investigations, and presents our opinions and recommendations regarding the proposed project.

We appreciate the opportunity to be of service on this phase of the project, and look forward to being of service as the project progresses. If you have any comments or questions, please contact this office at your convenience.

Sincerely,

KLEINFELDER

William C Siegel

Laboratory Test Results Raw Data

INTRODUCTION

General

This report presents the results of a geotechnical investigation performed at the site of the Flamingo Wash Detention Basin in Clark County, Nevada. The purposes of the investigation were to:

- assess the nature and engineering properties of the subsurface soils,
- provide analysis and recommendations to aid in the design of the proposed project, and
- provide a discussion regarding various construction related items including the presence of cemented soils.

The investigation included subsurface exploration, representative soil sampling, field and laboratory testing, engineering analysis, and preparation of this report.

A site plan/topographic map provided by the client was utilized as a reference for this investigation.

Project Description

The proposed Flamingo Wash Detention Basin is to be located generally at the southeast corner of Hacienda Road and Durango Drive in Clark County, Nevada. The basin will be utilized to detain flows in the upper Flamingo Wash due to design storm events and control discharge into the Flamingo Wash downstream of the basin.

The embankment for the basin will have a maximum height of approximately 36 to 38 feet and will be approximately 4800

feet in length. The embankment will have an on-channel, concrete labyrinth spillway connected to a 3100 foot discharge channel which will convey flows from the basin into the Flamingo Wash. The labyrinth spillway will be 20 to 25 feet in height.

We understand that the embankment will be constructed of alluvial sands and gravels (on-site soils) and will utilize an internal drainage system that will safely control and convey seepage. The client has indicated that with the exception of surficial relatively fine grained soils and oversized cemented pieces, the native soils will be used as embankment fill. Filter materials will be obtained by screening native soils to provide a uniformly graded material three inch to No. 4 sieve size. The embankment, spillway, and other features of this project will be designed by the client, utilizing design recommendations from Kleinfelder, Inc. when applicable.

Report Format

The initial sections of this report describe the proposed development and the field and laboratory phases of the study. These sections are followed by a discussion of the general site and soil conditions, as well as comments relative to geologic conditions. The subsequent sections pre-

sent our opinions and recommendations with regard to the geotechnical phases of the project. A vicinity map, summaries of all field explorations, and laboratory test results are presented in appendices following the text of the report.

FIELD INVESTIGATION

Drilling and Trenching. The subsurface soil conditions at the project site were explored by excavating a total of 31 borings and 29 trenches. The approximate breakdown of the explorations is as follows:

Location	Number of Borings	Number of Trenches
Embankment	16	17
Borrow Area/basin	8	12
Drainage channel	7	--

Five of the borings and 11 of the trenches were excavated for a preliminary investigation conducted by our firm at the subject site. The results of those explorations, and other field and laboratory tests conducted for the preliminary investigation, have been included in this final report.

The borings and trenches were numbered consecutively. Where borings and trenches were excavated near known stationing, the approximate stationing is also noted on the boring log.

Logs of the subsurface conditions, as encountered in the explorations, were recorded at the time of drilling and trenching, and are presented on Plates 2 through 32 (boring logs) and Plates 33 through 68 (trench logs). A key to soil symbols and terms is presented on Plate 69.

Drilling was accomplished with truck-mounted drill rigs equipped for soil sampling, utilizing rotary-air and rotary-wash drilling. Soil samples were obtained using a 2.6-inch diameter thick-walled (JHKA) sampler driven by a 350-pound hammer free-falling through a distance of 30 inches. Sampler driving resistance, expressed as "blows per foot of penetration", is presented on the boring logs at the respective sampling depths. The samples were classified by a field engineer/field geologist and representative portions of each sample were packaged and transported to our laboratory for testing.

It was attempted to obtain cores of cemented material utilizing an NX-core barrel. However, coring with the barrel utilized was only possible below five feet in depth. Cemented deposits at the site were generally found near the ground surface, and could not be cored. It was attempted to obtain a core of partially cemented soils encountered below 5 feet but competent cores could not be recovered.

Trenching was accomplished with a Case 580D backhoe. All soil samples from trenches were obtained with hand sampling equipment, were classified by a field engineer/field geologist, and were packaged and transported to our laboratory for testing.

The trenches were backfilled with the excavated soils to the extent possible with the equipment on hand. However, the backfill was not compacted to requirements of "structural fill". If any improvements are to be located in the vicinity of any of the trenches, the backfill should be removed and replaced with "structural fill" as defined in this report. Failure to properly compact backfill could result in excessive settlement of improvements located over trenches.

Boring elevations indicated on the individual boring logs in the upper right-hand corner were provided by the client based upon field locations provided by this office.

Sand Cone Density Tests. Ten Sand Cone Density tests (ASTM D-1556) were performed in the trenches excavated. The sand cone tests were performed at various depths to evaluate the in-place dry density and the field moisture content of the subsurface soils. The results of the tests are presented on the trench logs (Plates 44-61).

Seismic Refraction Tests. Eight seismic refraction tests were conducted to evaluate the shear wave velocity of the near surface cemented soils. The tests were conducted utilizing a seismic vibration monitor at geophone intervals of up to 100 feet. The approximate locations of the seismic lines are shown on Plate 1, while the results of the tests are presented in the tables of test results following the text of this report.

In-situ Infiltration Tests. Six in-situ (field) infiltration tests were conducted to aid in the evaluation of the permeability of the subsurface soils. The tests were conducted by isolating a screened section of PVC pipe packed in gravel and infiltrating with water utilizing either constant head or falling head techniques. The location and depth of the screened intervals was determined by the client.

LABORATORY INVESTIGATION

Representative samples were tested in the laboratory to determine the pertinent physical and engineering properties of the subsurface soils. The laboratory testing program was directed primarily toward classification of the subsurface soils, evaluation of strength and subsurface soil parameters for embankment design, and assessment of permeability of embankment and foundation soils. The laboratory testing program is described in the following sections.

Grain Size Analysis. Seventeen sieve analyses were conducted to assess the grain size distribution of the subsurface soils and to verify our field classification. The results of the tests performed are presented graphically on Plates 62-67.

Direct Shear Tests. Nine direct shear tests were conducted on representative samples to assess shear strength characteristics of the subsurface soils. The tests were conducted on portions of the samples passing the No. 4 sieve remolded into a direct shear apparatus with a stationary bottom half and an upper half capable of lateral movement. Utilizing normal loads ranging from 1000 to 5000 psf, the sample was sheared and applicable data was recorded. Assessment of the angle of internal friction and measurement of cohesion was then conducted based on the data obtained from the tests. Because of the granular nature of the samples, the measured cohesion values likely represent friction of fine sand grains in the direct shear apparatus between the stationary and moveable portions of the sample rather than cohesion of fine grained soil particles.

Laboratory Permeability Tests. Seven laboratory permeability tests were conducted on remolded samples of soil collected during our field investigation. The tests were utilized to aid in the assessment of the permeability of the

subsurface soils to be utilized in construction of the embankment. Three tests were conducted in 4-inch diameter molds utilizing portions of the samples passing the 3/8-inch sieve recompacted to 115 pcf. Four tests were conducted in 12-inch diameter molds utilizing whole bulk samples recompacted as near as possible to field density (generally 90 to 100 percent of maximum dry density).

Maximum Density/Optimum Moisture Content Determination. Three maximum density/optimum moisture content determinations were conducted to evaluate the compaction characteristics of the subsurface soils and for use in evaluating the relative field density of the soils at the sand cone test locations.

Specific Gravity Tests. One specific gravity test was conducted on a representative sample to aid in the assessment of the subsurface soils and for use in embankment design.

The results of all laboratory tests are presented in the tables of test results following the text of this report, and on Plates 62-67 (grain size analysis). Selected raw data and/or the equations utilized in determining the values for test results presented in this report are presented in Appendix A.

GENERALIZED SOIL CONDITIONS

Site Conditions

At the time of our field investigation, the site was undeveloped desert. The topography was dominated by the presence of the Flamingo Wash, with the overall site sloping to the northeast. The ground surface was slightly vegetated, with somewhat heavier vegetation present near the wash. Several dirt roads crossed the site, and areas of scattered trash and debris were present, primarily near the roads.

Surficial sand deposits were encountered over a majority of the site, with some areas of gravels and cobbles exposed in the wash bottoms.

Generalized Subsurface Conditions

Based upon the 31 borings advanced and 29 trenches excavated for this investigation, the subsurface soils on the site are predominantly combinations of sand and gravel with traces of silt and some cobbles. The surficial soils generally contain higher percentages of silt and, although loose at the ground surface, were generally medium dense to dense below one or two feet. Deeper deposits contained less silt and were generally very dense.

Calcareous cemented materials were encountered in many of our explorations. These soils were usually calcareous

cemented combinations of sand and gravel and are described on our boring logs as "cemented sand and gravel". However, in some areas the calcareous cemented material was composed of fine grained soils and are described on our boring logs as "caliche". The cemented material was often present near the ground surface, and was generally moderately hard to hard in consistency. The results of the seismic refraction tests indicate that the near surface cemented soils exhibit measured velocities varying from 3000 to 4600 feet per second. Based upon available published literature, these velocities would correspond to relatively soft limestone or sandstone. Ground water was not encountered to the depths explored.

More detailed descriptions of the subsurface soil conditions are presented on the boring and trench logs following the text of this report. The contractor should be aware, however, that the boring and trench logs represent a general description of the conditions encountered at the boring or trench location. Cemented deposits are quite variable and additional and harder cemented deposits may be encountered beyond the locations explored.

GEOLOGIC CONDITIONS

Geologic Setting

The site of the proposed development is located within the southwest portion of the Las Vegas Valley. The Las Vegas Valley is filled with Quarternary and Tertiary aged unconsolidated sediments derived from the surrounding mountains.

The valley floor consists of alluvial and playa deposits surrounded by more steeply sloping alluvial aprons derived from erosion of the mountains surrounding the valley. The major source of the alluvial material is the Spring Mountain range located to the west of the valley. Generally, the grading of the sediments becomes increasingly finer with distance from the source area and with decreasing elevation. The alluvial and playa sediments can be several thousand feet thick in areas.

At the project site, the soils within the depths explored are alluvial deposits derived from the Spring Mountain Range west of the project site. The material is predominately of limestone origin, although some sandstone material is also present. Groundwater was not encountered during our field investigation and is anticipated to be greater than 75 feet in depth. Cemented deposits are the results of in-place, secondary cementation by calcium carbonate, and to a lesser

extent, magnesium carbonate. The cementation is derived primarly from the limestone mountains west of the project site. Outcroppings of bedrock are present immediately northwest of the subject site. We would anticipate that the total depth of alluvium at the site is less than 500 feet.

Seismicity and Tectonic Faulting

Numerous seismic events of Richter magnitude 3.0 or greater have been recorded in the Las Vegas area. Most were a probable result of underground blasting (some as high as 5.8 Richter magnitude) at the Nevada Test Site which remains the major source of seismic activity in the Las Vegas area. Tectonic shocks having epicenters within the Southern Nevada areas have been minimal.

The Las Vegas Valley is located in Seismic Zone 2 as categorized in the Uniform Building Code. Zone 2 represents a low to moderately active seismic area. No geologically recent (within the last 10,000 years) bedrock or tectonic faults are known to transect the alluvium deposits at the site of the proposed development. The nearest fault with evidence of possible geologically recent displacement is located at the base of Frenchman's Mountain. This fault is approximately 15 miles east of the project. The Las Vegas shear zone is also located approximately 15 miles north of

the site. Although generally considered inactive, a recent small (Richter magnitude less than 3.0) tectonic shock with an epicenter in the vicinity of the shear zone may indicate that the zone is active. A map of the geologic features relevant to the project is presented on Plate 1A.

Based upon the location of the site relative to faults exhibiting possible geologically recent movement, and our knowledge of the Las Vegas Valley area, we recommend that for design purposes, a maximum horizontal acceleration of 0.095g be utilized. An analysis to evaluate the vertical acceleration would require an extensive computer modeling beyond the scope of this study. However, in absence of such an analysis, the current standard is to assume the vertical acceleration will be approximately two-thirds of the maximum horizontal acceleration. Therefore, we recommend that a vertical acceleration of .06g be used in design.

Non-Tectonic Features

The nearest mapped compaction faults are located approximately five miles east of the project site (Bell, 1981). Compaction faults, which occur within unconsolidated alluvial deposits, are considered the result of differential consolidation of deep alluvial and lacustrine sediments having dissimilar grain size and consolidation charac-

teristics. The faults are not bedrock faults, although the displacement may have been at least partly induced by an earthquake. The age of one of these escarpments has been dated at about 14,000 years old. Differential stress including the presence of "fissures", has in some cases been localized near these compaction faults. This appears to be the result of regional and local subsidence due to the withdrawal of ground water from principal aquifers.

No indications of any significant differential subsidence or ground displacement which might adversely affect the project site were observed. Although there has been widely documented subsidence in the Las Vegas Valley due to groundwater withdrawal, differential subsidence at the site of the proposed embankment, if present, is anticipated to be relatively minor under current levels of ground water withdrawal and recharge (i.e., less than one-tenth inch per 1000 feet). Any changes, however, in ground water withdrawal rates may result in additional subsidence at the site and may possibly require consideration by the design engineer.

ENGINEERING ANALYSIS AND RECOMMENDATIONS

General

As indicated in earlier sections, the soils of the project site were primarily sands and gravels with lesser amounts of

silt and cobbles. The following paragraphs present our opinions and recommendations regarding the site.

Design Parameters For Slope Stability Analysis

Based upon the results of the field and laboratory investigations, the following paragraphs present our recommendations for design parameters for use in slope stability analysis:

Strength Parameters. The results of the direct shear tests indicated that the portion of the sample passing the No. 4 sieve generally exhibited angles of internal friction of 36 degrees or greater. The friction values of the entire sample are expected to be somewhat greater than the measured values. However, because two samples exhibited values slightly less than 36 degrees, we recommend that a value of 36 degrees be utilized for design.

Although some cohesion was measured during testing (see earlier description of direct shear tests), the samples are not expected to have cohesion to a degree which can safely be utilized for design. Therefore, we recommend that no cohesion be utilized in design.

Soil Properties. Based upon the preliminary specifications for soil embankment material provided by the client, a spe-

cific gravity of 2.61 and a maximum dry density of 134.0 pcf would be applicable for the embankment soils. A specific gravity of 2.63 should be utilized for the filter material.

Site Preparation and Grading

After stripping and removing any trash and debris, any other deleterious materials should be excavated. The excavations should extend laterally at least five feet beyond the perimeter of the embankment structure.

To provide a competent base for the proposed embankment and structures, we recommend that the surficial loose to medium dense native soils, and any soils disturbed during clearing and grubbing operations, be overexcavated to expose competent medium dense soils. Following excavation of the surficial soils, the exposed natural soils should be moistened to about optimum moisture content and compacted to at least 92 percent of maximum dry density as determined by ASTM D-1557. Where very dense or cemented soils are exposed in excavations, recompaction may be omitted.

Following excavation and recompaction, the excavated natural soils may then be placed in the excavations in maximum 8-inch loose lifts and compacted at about optimum moisture content to 92 percent of ASTM D-1557. We anticipate that the overexcavations will extend approximately one to three feet below the existing ground surface.

Soils exposed at subgrade level should be kept moist and not allowed to dry out. If the soils dry out prior to construction, the subgrade should be soaked and the moisture content increased to the recommended value.

Foundations

The client has indicated that counterfort retaining walls of up to 40 feet in height will be utilized at the central spillway structure. In addition, cantilevered retaining walls may also be used. Structures may be supported on conventional spread footings founded on medium dense to very dense soils or on cemented soils. However, footings should not be supported by a combination of cemented and uncemented soils. Where both cemented and uncemented soils are encountered, the footings should be extended to the caliche or the caliche should be overexcavated such that one foot of structural fill is placed between footings and cemented soils. The natural soils and/or structural fill should have been prepared as recommended in the "Site Preparation and Grading" section of this report.

We understand the footings will be embedded a minimum of two feet below lowest adjacent compacted grade. Although contilevered retaining walls may have footings as narrow as three feet in width, footings for counterfort retaining

walls will be on the order of 28 feet wide. Footings may be proportioned for a maximum net allowable bearing pressure in accordance with the following equation:

$$q_{all} = 1000\ B + 1300\ D,\ psf$$

where:

q_{all} = net allowable bearing pressure, psf
B = footing width, ft.
D = depth of embedment, ft.

A maximum net allowable bearing pressure of 6000 psf should be observed. A one-third increase may be used for transient wind and seismic loads.

Prior to constructing the foundations, the footing excavations should be observed by the Geotechnical Engineer to determine whether suitable bearing soils have been exposed and whether the excavation bottoms are free of loose or disturbed soils.

Settlement

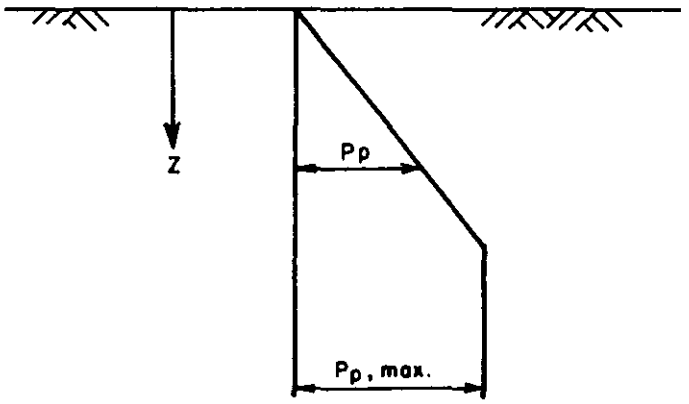
Embankment. Total anticipated settlement under the proposed embankment will vary in relation to the embankment height, with a maximum settlement anticipated to be less than one-half inch under the central portion of the embankment. Differential settlements are anticipated to be minor over the length of the embankment. Because of the granular nature of the subsurface soils, most of the settlement is anticipated to occur during construction.

Footings. Total anticipated settlement under footings will be on the order of one-half inch or less. Differential settlement for footings bearing on natural medium dense soil or properly placed structural fill is expected to be less than one-half inch.

Resistance to Lateral Loads and Retaining Walls

Horizontal loads acting on foundations formed in open excavations will be resisted by friction acting on the base of foundations, and by passive earth pressures. If design makes use of passive earth pressure, the backfill should be compacted to the requirements of structural fill. It is also important that potential scour be accounted for when considering passive resistance.

The friction acting along the base of footings founded on suitable foundation soils may be computed by using an allowable coefficient of friction of 0.40 with the normal dead load. An allowable lateral passive earth pressure may be computed by using an equivalent fluid weighing 450 pcf for the side of footings poured against natural soils or properly placed and compacted backfill. The maximum allowable passive pressure should not exceed 3000 psf. Passive pressure in the upper foot or to the potential scour depth should be ignored unless confined by concrete slab-on-

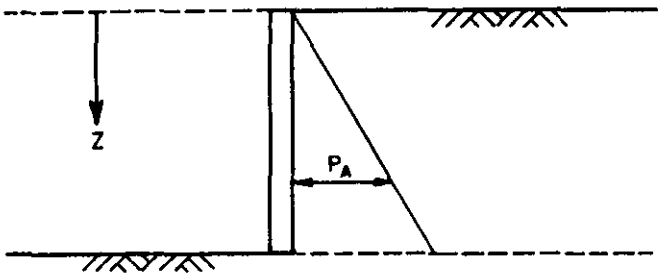


grade. The values given above may be increased by one-third for transient wind or seismic loads.

As indicated in an earlier section, counterfort retaining walls will be used. In addition, the client has indicated that short (10 feet or less) retaining walls may be utilized. Backfill behind retaining walls should be embankment fill material (i.e., granular soils) and should be placed and compacted to the requirements of embankment fill (i.e., minimum 92 % relative compaction).

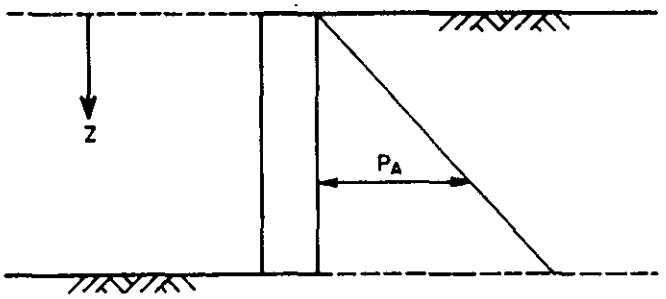
Lateral earth pressures acting on retaining walls may be computed in accordance with the attached Figure 1. These pressures assume no hydrostatic buildup behind the walls. The design engineer should consider drains or design the walls to resist such pressures if they can develop.

Seepage



Permeability. Although the values of field and laboratory permeability varied somewhat, it is our opinion that a value of $1X10^{-3}$ cm/sec represents the "average" soil condition present. Somewhat higher permeabilities, on the order of $1X10^{-2}$ cm/sec are more likely present in the clean gravels and cobbles found near the surface in the wash bottoms. Since permeability values denote a capacity of soils to conduct water under a given hydraulic gradient, the actual

$P_p = \tan^2(45+\phi/2)\gamma$



P_p, max. = 3000 psf

A. PASSIVE PRESSURE

$P_A = \tan^2(45-\phi/2)\gamma$

B. ACTIVE PRESSURE: CANTILEVERED RETAINING WALLS

$P_A = 1.5 \tan^2(45-\phi/2)\gamma$

C. ACTIVE PRESSURES: COUNTERFORT RETAINING WALLS (RIGID WALLS)

KLEINFELDER

PROJECT NO. 128106

LATERAL PRESSURES ON WALLS BELOW GRADE

FIGURE 1

volume of vertical and horizontal movement of water in and beneath the embankment will vary in relation to the hydraulic gradient.

Seepage Control. We understand that control of the seepage beneath the spillway and embankment will be required. Seepage control will be accomplished by utilizing drains, an upstream blanket of lower permeability material (possibly composed of surficial, on-site relatively fine grained soils), or by a seepage control device beneath the embankment. Because of the nature of the soils present, cut-off walls and/or grouting appear to be the most practical alternatives for seepage control beneath the embankment. Cut-off walls may be composed of lean concrete, soil cement, lower permeability soils such as clays, or a minimum 20 mil pvc liner. The client has indicated that a concrete shear key or other type of structural element may also be utilized as a cut-off wall.

Because ground water is not present, a number of grouting options appear practical. However, we anticipate that a portland cement grout would be the most cost-effective and impermeable material. Specific design recommendations for grouting were not provided because the location and extent of the required seepage control was not known.

Erosion Protection

Embankment and channel side slope materials should be protected to prevent erosion due to wave action and flows within the discharge channel. Rip-rap or soil cement may effectively be used to minimize potential erosion. The nature and thickness of erosion protection materials will be dependent upon a number of factors including slope of embankment or channel, wave heights, design flow velocities, etc. However, the following preliminary conclusions and opinions can be provided:

- cement contents for soil-cement are anticipated to be on the order of 8 to 12 percent by weight.
- thicknesses on the order of 12 to 18 inches are anticipated for soil-cement materials on the embankment face, with slightly thicker sections possibly required for the discharge channel.
- rip-rap may be composed of sound rock or broken-up pieces of cemented sand and gravel. However, partially cemented or weathered material may not be utilized.

Construction Considerations

As indicated in earlier sections, extensive deposits of calcareous cemented deposits were encountered throughout the project site. The deposits were generally moderately hard to hard, and were present near the ground surface. The seismic wave velocities of the materials were measured at eight locations and are presented in the tables of test

results following the text of this report. We anticipate that difficulty will be encountered excavating the cemented materials, and the very dense uncemented soils encountered at the site. Based upon published literature by manufacturers, soils exhibiting velocities in the range of the seismic wave test results may be removed by ripping with a Caterpiller D9H ripper or equivalent. However, excavation techniques including ripping, blasting, headache balls, and backhoe-mounted hammers may be necessary. The contractor should be aware that caliche is quite variable and additional or harder deposits may be encountered beyond the location explored.

Because of the potential for vibrational damage to nearby structures and structures under construction at the site, the contractor should submit a proposed excavation plan prior to removal operations. In addition, the peak particle velocity at nearby structures or structures under construction at the site should not exceed two inches per second.

The contractor should perform his own trial excavation as he deems necessary to ascertain the type of equipment and excavation effort needed for the earthwork operations.

CLOSURE

Limitations

The recommendations contained in this report are based on our field explorations, laboratory tests, and our understanding of the proposed construction. The subsurface data used in the preparation of this report was obtained from the 31 borings advanced and 29 trenches excavated for this investigation. It is possible and likely that variations in the soil and groundwater conditions could exist between the points explored. The nature and extent of variations may not be evident until construction occurs. If any conditions are encountered at this site which are different from those described in this report, our firm should be immediately notified so that we may make any necessary revisions to recommendations contained in this report. In addition, if the scope of the proposed construction changes from that described in this report, our firm should also be notified.

This report was prepared in accordance with the generally accepted standard of practice at the time the report was written. No other warranty, express or implied, is made.

It is the Client's responsibility to see that all parties to the project including the Designer, contractor, Subcontractors, etc. are made aware of this report in its

entirety. The use of information contained in this report for bidding purposes should be done at the Contractor's option and risk.

Additional Services

The recommendations made in this report are based on the assumption that an adequate program of tests and observations will be made during the construction to verify compliance with these recommendations. These tests and observations should include, but not necessarily be limited to, the following:

- Observations and testing during site preparation and earthwork, including preparation of subgrade and fill placement.
- Consultation as may be required during construction.

We also recommend that project plans and specifications be reviewed by us to verify compatibility with our conclusions and recommendations. Additional information concerning the scope and cost of these services can be obtained from our office.

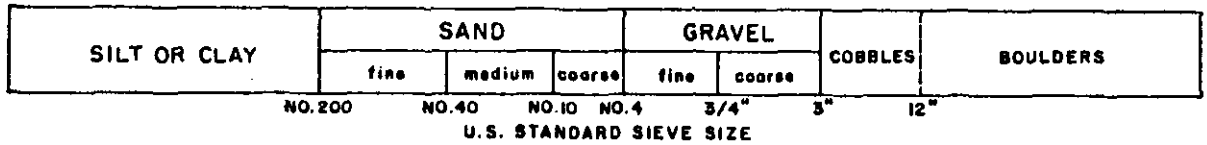

PLATE 67

MAJOR DIVISIONS			Group Symbols	TYPICAL NAMES
COARSE GRAINED SOILS More than 50% of material is larger than the No. 200 sieve	GRAVELS More than 50% of coarse part is larger than the No. 4 sieve	CLEAN GRAVELS Little or no fines	GW	Well graded gravels, gravel-sand mixtures, little or no fines
			GP	Poorly graded gravels or gravel-sand mixtures, little or no fines
		GRAVELS WITH FINES Appreciable amount of fines	GM	Silty gravels, gravel-sand-silt mixtures
			GC	Clayey gravels, gravel-sand-clay mixtures
	SANDS More than 50% of coarse part is smaller than the No. 4 sieve	CLEAN SANDS Little or no fines	SW	Well graded sands, gravelly sands, little or no fines
			SP	Poorly graded sands or gravelly sands, little or no fines
		SANDS WITH FINES Appreciable amount of fines	SM	Silty sands, sand-silt mixtures
			SC	Clayey sands, sand-clay mixtures
FINE GRAINED SOILS More than 50% of material is smaller than the No. 200 sieve	SILTS AND CLAYS Liquid limit LESS than 50		ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with low plasticity
			CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
			OL	Organic silts and organic silty clays of low plasticity
	SILTS AND CLAYS Liquid limit GREATER than 50		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
			CH	Inorganic clays of high plasticity, fat clays
			OH	Organic clays of medium to high plasticity, organic silts
HIGHLY ORGANIC SOILS			PT	Peat and other highly organic soils

BOUNDARY CLASSIFICATIONS: Soils possessing characteristics of two groups are designated by combinations of group symbols.

PARTICLE SIZE LIMITS

DESCRIPTIVE TERMS USED WITH SOILS

CONSISTENCY			MOISTURE CONTENT
	SILTS AND CLAYS	SANDS AND GRAVELS	
STRONGEST ↑	very stiff	very dense	WETTEST ↑ wet
	stiff	dense	very moist
	firm	medium dense	moist
	soft	loose	slightly moist
WEAKEST ↓			DRIEST ↓ dry

	CALICHE	CEMENTED SAND AND GRAVEL	IDENTIFICATION TEST USING KNIFE AND STANDARD GEOLOGIST'S HAMMER
STRONGEST ↑	very hard	very hard	Difficult to scratch or break
	hard	hard	Scratches leave only dust, requires many hammer blows to break
	moderately hard	moderately hard	Can be readily cut with knife and crumbles with several hammer blows
WEAKEST ↓	partially cemented	partially cemented	Gouges easily with knife and crumbles readily with a few blows of a hammer

EXPLANATION OF MATERIAL CLASSIFICATIONS

PLATE NO. 68

APPENDIX A

Laboratory Test Results Raw Data

1. LABORATORY FALLING HEAD PERMEABILITY

$$K = \frac{2.3\,a\,L}{A\,\Delta T} \log \frac{h_1}{h_2}$$

where:
- a = standpipe area
- L = sample length
- A = sample area
- h_1 = initial head
- h_2 = final head
- ΔT = time difference

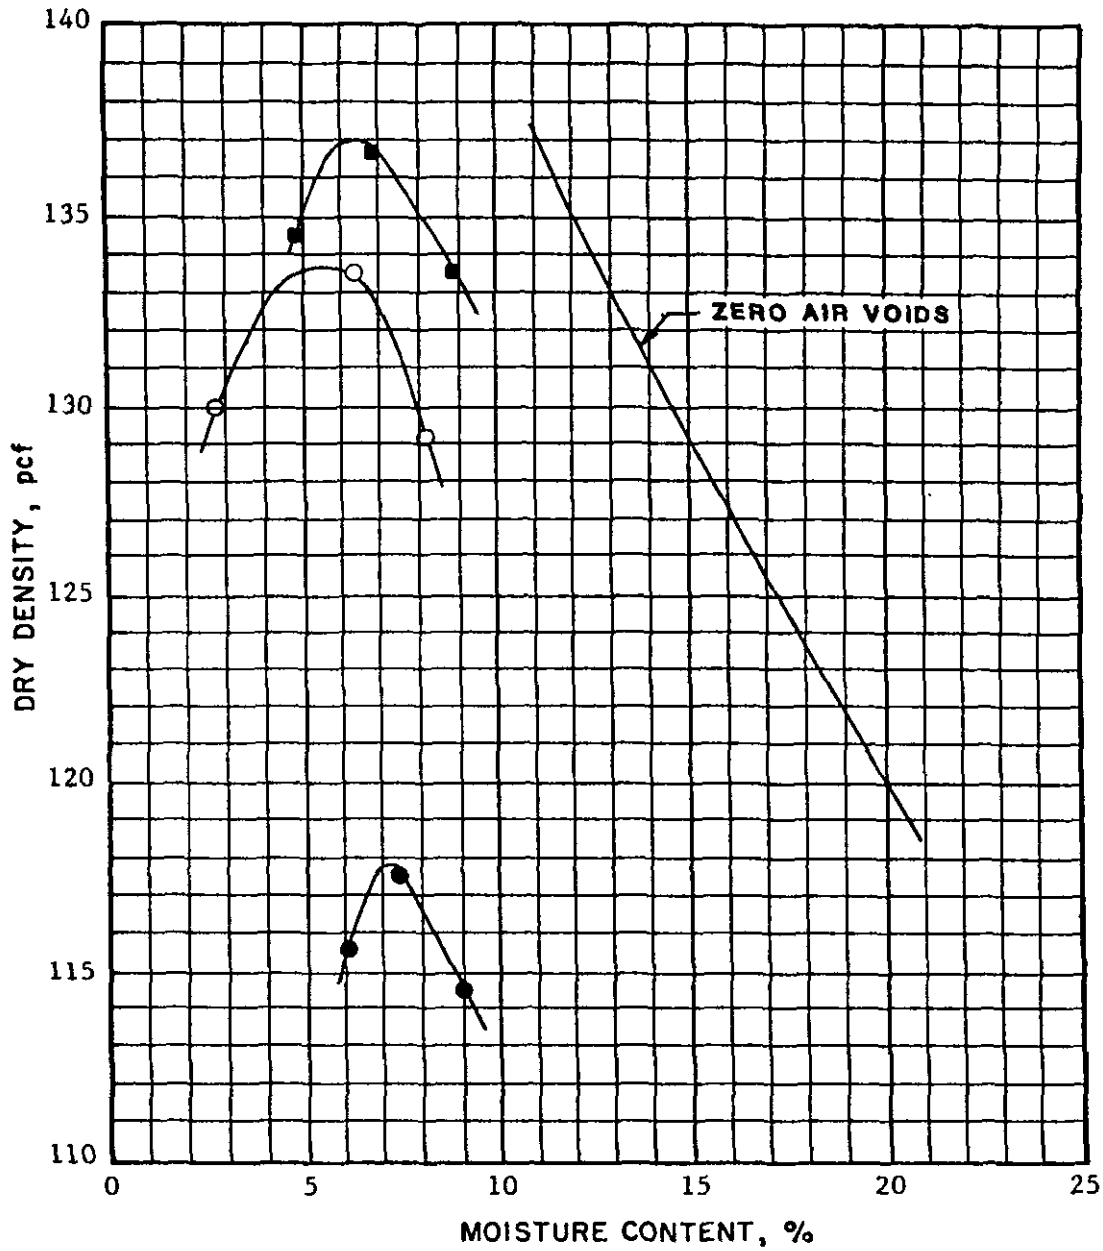
2. IN-SITU FALLING HEAD TEST

$$K = \frac{R^2}{2L\,\Delta T} \text{Ln} \frac{L}{R} \text{Ln} \frac{H_1}{H_2}$$

where:
- R = hole radius
- L = slotted interval
- ΔT = time difference
- H_1 = initial head
- H_2 = final head

3. IN-SITU CONSTANT HEAD TEST

$$K = \frac{q \cdot \text{Ln}\left[\frac{mL}{D} + \sqrt{1 + \left(\frac{mL}{D}\right)^2}\right]}{2\pi L h_c}$$



where:
- h_c = average head
- L = slotted length
- m = transformation ratio
- D = hole diameter
- q = volume/time

COMPRESSIVE STRENGTH OF CYLINDRICAL CONCRETE SPECIMENS

Client: Black & Veatch
1771 East Flamingo Road, Suite 104A
Las Vegas, NV 89119

Job No. 4141K255

Date of Report 02-12-92

Reviewed By EB

Project: Flamingo-Upper Wash Detention Basin & Discharge

Location: S/O Tropicana Ave & Durango

Contractor: J.A. Tiberti

Architect/Engineer: Black & Veatch

Source of Sample: Wall A3

Concrete Supplier: WMK Transit Mix

Measured Slump, in.: 6 3/4

Ticket Number: 24209

Measured Air Content, %: 6.0

Batch Size, cu.yds.: 10.0

Concrete Temperature, °F: 71

Mix Identification: W418P

Ambient Air Temperature, °F: 59

Design Strength, psi: 4000 / 28 days

Plastic Unit Weight, pcf: --

Max. Size Aggregate, in.: 3/4

No. of Cylinders Molded: 5

Time in Mixer: hrs. 45 min.

Sampled By: J. Usrey Date: 01/15/92

Water Added on Job, gal.: 0

Submitted By: J. Usrey Date: 01/16/92

Test Procedure: ASTM C39- 84B

Authorized By: G. Sommerfield Date: 01/14/92

Remarks

Note: Cylinders are 6 in. x 12 in., area = 28.27 sq. in. unless otherwise indicated

LABORATORY REPORT

COMPRESSIVE STRENGTH OF CYLINDRICAL CONCRETE SPECIMENS

Client: Black & Veatch
1771 East Flamingo Road, Suite 104A
Las Vegas, NV 89119

Job No. 4141K255

Date of Report 02-03-92

Reviewed By EB

Project: Flamingo-Upper Wash Detention Basin & Discharge

Location: S/O Tropicana Ave & Durango

Contractor: JA Tiberti — Architect/Engineer: Black & Veatch

Source of Sample: Labyrinth wall section D3 & B5

Concrete Supplier: WMK Transit Mix — Measured Slump, in.: 5 1/2

Ticket Number: 22820 — Measured Air Content, %: 2.5

Batch Size, cu.yds.: 10.0 — Concrete Temperature, °F: 60

Mix Identification: W-418 — Ambient Air Temperature, °F: 46

Design Strength, psi: 4000 / 28 days — Plastic Unit Weight, pcf: --

Max. Size Aggregate, in.: 3/4 — No. of Cylinders Molded: 5

Time in Mixer: 2 hrs. ____ min. — Sampled By: P. Boedeker — Date: 01/06/92

Water Added on Job, gal.: 10 — Submitted By: P. Boedeker — Date: 01/07/92

Test Procedure: ASTM C39- 84B — Authorized By: Gary — Date: 01/03/92

Remarks

Note: Cylinders are 6 in. x 12 in., area = 28.27 sq. in. unless otherwise indicated

LABORATORY REPORT

COMPRESSIVE STRENGTH OF CYLINDRICAL CONCRETE SPECIMENS

Client: Black & Veatch
1771 East Flamingo Road, Suite 104A
Las Vegas, NV 89119

Job No. 4141K255

Date of Report 12-10-91

Reviewed By EB

Project: Flamingo-Upper Wash Detention Basin & Discharge

Location: S/O Tropicana Ave & Durango

Contractor: Tiberti Construction

Architect/Engineer: Black & Veatch

Source of Sample: Labyrinth Wall 6-7

Concrete Supplier: WMK Transit Mix

Measured Slump, in.: 6 1/4

Ticket Number: 18649/Truck 16

Measured Air Content, %: 4.1

Batch Size, cu.yds.: 10.0

Concrete Temperature, °F: 78

Mix Identification: W418P

Ambient Air Temperature, °F: 71

Design Strength, psi: 4000 / 28 days

Plastic Unit Weight, pcf: --

Max. Size Aggregate, in.: 3/4

No. of Cylinders Molded: 5

Time in Mixer: 1 hrs. 10 min.

Sampled By: Phil Boedeker Date: 11/12/91

Water Added on Job, gal.: --

Submitted By: Phil Boedeker Date: 11/13/91

Test Procedure: ASTM C39- 84B

Authorized By: Oliver Date: 11/12/91

Remarks

Note: Cylinders are 6 in x 12 in, area = 28.27 sq. in unless otherwise indicated

COMPRESSIVE STRENGTH OF CYLINDRICAL CONCRETE SPECIMENS

Client: Black & Veatch
1771 East Flamingo Road, Suite 104A
Las Vegas, NV 89119

Job No. 4141K255

Date of Report 11-26-91

Reviewed By

Project: Flamingo-Upper Wash Detention Basin & Discharge

Location: S/O Tropicana Ave & Durango

Contractor: Tiberti Construction — Architect/Engineer: Black & Veatch

Source of Sample: N Spillway retaining wall footing slab on grade, section 1,*

Concrete Supplier: WMK Transit Mix — Measured Slump, in.: 4 1/4

Ticket Number: 17656 — Measured Air Content, %: 4.2

Batch Size, cu.yds.: 10.0 — Concrete Temperature, °F: 74

Mix Identification: W418 6.5 sack — Ambient Air Temperature, °F: 66

Design Strength, psi: 4000 / 28 days — Plastic Unit Weight, pcf: --

Max. Size Aggregate, in.: 3/4 — No. of Cylinders Molded: 5

Time in Mixer: ____ hrs. 54 min. — Sampled By: Mark Sherrod — Date: 10/29/91

Water Added on Job, gal.: -- — Submitted By: Mark Sherrod — Date: 10/30/91

Test Procedure: ASTM C39- 84B — Authorized By: G. Sommerfeld — Date: 10/28/91

Remarks
*E third, upper portion

Note: Cylinders are 6 in. x 12 in., area = 28.27 sq. in. unless otherwise indicated

COMPRESSIVE STRENGTH OF CYLINDRICAL CONCRETE SPECIMENS

Client: Black & Veatch
1771 East Flamingo Road, Suite 104A
Las Vegas, NV 89119

Job No. 4141K255

Date of Report 11-11-91

Reviewed By EB

Project: Flamingo-Upper Wash Detention Basin & Discharge

Location: S/O Tropicana Ave & Durango

Contractor: Tiberti Construction — Architect/Engineer: Black & Veatch

Source of Sample: Spillway slab on grade, S retaining wall footing, section*

Concrete Supplier: WMK Transit Mix — Measured Slump, in.: 4

Ticket Number: 16355 — Measured Air Content, %: 3.9

Batch Size, cu.yds.: 10.0 — Concrete Temperature, °F: 86

Mix Identification: W418 6.5 sack — Ambient Air Temperature, °F: 87

Design Strength, psi: 4000 / 28 days — Plastic Unit Weight, pcf: --

Max. Size Aggregate, in.: 3/4 — No. of Cylinders Molded: 5

Time in Mixer: ____ hrs. 56 min. — Sampled By: Mark Sherrod — Date: 10/14/91

Water Added on Job, gal.: -- — Submitted By: Mark Sherrod — Date: 10/15/91

Test Procedure: ASTM C39- 84B — Authorized By: G. Sommerfeld — Date: 10/11/91

Remarks

*1, W third, upper portion

Note: Cylinders are 6 in. x 12 in., area = 28.27 sq. in. unless otherwise indicated

LABORATORY REPORT

COMPRESSIVE STRENGTH OF CYLINDRICAL CONCRETE SPECIMENS

Client: Black & Veatch
1771 East Flamingo Road, Suite 104A
Las Vegas, NV 89119

Job No.: 4141K255

Date of Report: 10-22-91

Reviewed By: EB

Project: Flamingo-Upper Wash Detention Basin & Discharge

Location: S/O Tropicana Ave & Durango

Contractor: Tiberti Construction — Architect/Engineer: Black & Veatch

Source of Sample: Spillway slab on grade, section E6, lower portion

Concrete Supplier: WMK Transit Mix — Measured Slump, in.: 3 3/4

Ticket Number: 13984 — Measured Air Content, %: 3.2

Batch Size, cu.yds.: 10.0 — Concrete Temperature, °F: 83

Mix Identification: W418 6.5 sack — Ambient Air Temperature, °F: 68

Design Strength, psi: 4000 / 28 days — Plastic Unit Weight, pcf: --

Max. Size Aggregate, in.: 3/4 — No. of Cylinders Molded: 5

Time in Mixer: ____ hrs. 47 min. — Sampled By: Mark Sherrod — Date: 09/24/91

Water Added on Job, gal.: 5 — Submitted By: Mark Sherrod — Date: 09/25/91

Test Procedure: ASTM C39- 84B — Authorized By: G. Sommerfeld — Date: 09/23/91

Remarks

Note: Cylinders are 6 in x 12 in., area = 28.27 sq. in unless otherwise indicated

Contractor: Tiberti Construction — Architect/Engineer: Black & Veatch

Source of Sample: Spillway slab on grade, section C4, upper portion

Concrete Supplier: WMK Transit Mix — Measured Slump, in.: 3 1/2

Ticket Number: 13145 — Measured Air Content, %: 3.4

Batch Size, cu.yds.: 10.0 — Concrete Temperature, °F: 81

Mix Identification: W418 6.5 sack — Ambient Air Temperature, °F: 79

Design Strength, psi: 4000 / 28 days — Plastic Unit Weight, pcf: --

Max. Size Aggregate, in.: 3/4 — No. of Cylinders Molded: 4

Time in Mixer: ____ hrs. 32 min. — Sampled By: Mark Sherrod — Date: 09/16/91

Water Added on Job, gal.: 5 — Submitted By: Mark Sherrod — Date: 09/17/91

Test Procedure: ASTM C39- 84B — Authorized By: G. Sommerfeld — Date: 09/13/91

Remarks

Note: Cylinders are 6 in. x 12 in., area = 28.27 sq. in. unless otherwise indicated

Job No. 4141K255

Date of Report 10-11-91

Reviewed By EB

Project: Flamingo-Upper Wash Detention Basin & Discharge

Location: S/O Tropicana Ave & Durango

Contractor: Tiberti Construction — Architect/Engineer: Black & Veatch

Source of Sample: Spillway slab on grade, section C-3, lower portion

Concrete Supplier: WMK Transit Mix — Measured Slump, in.: 3 1/2

Ticket Number: 12691 — Measured Air Content, %: 2.1

Batch Size, cu.yds.: 10.0 — Concrete Temperature, °F: 78

Mix Identification: W-418 6.5 sack — Ambient Air Temperature, °F: 65

Design Strength, psi: 4000 / 28 days — Plastic Unit Weight, pcf: --

Max. Size Aggregate, in.: 3/4 — No. of Cylinders Molded: 4

Time in Mixer: 1 hrs. 21 min. — Sampled By: M. Sherrod — Date: 09/12/91

Water Added on Job, gal.: -- — Submitted By: M. Sherrod — Date: 09/11/91

Test Procedure: ASTM C39- 84B — Authorized By: G. Sommerfield — Date: 09/11/91

Remarks

Note: Cylinders are 6 in. x 12 in., area = 28.27 sq. in. unless otherwise indicated

LABORATORY REPORT

COMPRESSIVE STRENGTH OF CYLINDRICAL CONCRETE SPECIMENS

Client: Black & Veatch
1771 East Flamingo Road, Suite 104A
Las Vegas, NV 89119

Job No. 4141K255

Date of Report 09-27-91

Reviewed By

Project: Flamingo-Upper Wash Detention Basin & Discharge

Location: Tropicana Ave & Durango

Contractor: Tiberti Construction — Architect/Engineer: Black & Veatch

Source of Sample: Spillway slab section "J" lower portion

Concrete Supplier: WMK Transit Mix — Measured Slump, in.: 4 1/4

Ticket Number: 11874 — Measured Air Content, %: 4.0

Batch Size, cu.yds.: 10.0 — Concrete Temperature, °F: 79

Mix Identification: W-418 — Ambient Air Temperature, °F: 85

Design Strength, psi: 4000 / 28 days — Plastic Unit Weight, pcf: --

Max. Size Aggregate, in.: 3/4 — No. of Cylinders Molded: 4

Time in Mixer: ____ hrs. 51 min. — Sampled By: M. Sherrod — Date: 08/30/91

Water Added on Job, gal.: 2 — Submitted By: M. Sherrod — Date: 08/31/91

Test Procedure: ASTM C39- 84B — Authorized By: Client — Date: 08/29/91

Remarks

Note: Cylinders are 6 in. x 12 in., area = 28.27 sq. in. unless otherwise indicated

Job No. 4141K255

Date of Report 12-04-91

Reviewed By [signature]

Project Flamingo-Upper Wash Detention Basin & Discharge

Location S/O Tropicana Ave & Durango

Contractor Tiberti Construction — Architect/Engineer Black & Veatch

Source of Sample Box Culvert W wall, middle upper half

Concrete Supplier WMK Transit Mix — Measured Slump, in. 5

Ticket Number 15893 — Measured Air Content, % 8.2

Batch Size, cu.yds. 10.0 — Concrete Temperature, °F 86

Mix Identification W418 6.5 sack — Ambient Air Temperature, °F 83

Design Strength, psi 4000 / 28 days — Plastic Unit Weight, pcf --

Max. Size Aggregate, in. 3/4 — No. of Cylinders Molded 5

Time in Mixer 1 hrs. 30 min. — Sampled By Mark Sherrod — Date 10/09/91

Water Added on Job, gal. 10 — Submitted By Mark Sherrod — Date 10/10/91

Test Procedure ASTM C39- 84B — Authorized By G. Sommerfeld — Date 10/08/91

Remarks

Note: Cylinders are 6 in. x 12 in., area = 28.27 sq. in. unless otherwise indicated

Rapid Draw Down at PMF Pool Elev.	1.2 (Ref #1)	—
" " " " 10 yr " "	1.2 (Ref #1)	—
" " " " Partial " "	1.2 (Ref #1)	—
Earthquake (Empty Basin	1.1 (Ref #1)	1.1 (Ref #1)
End of Construction	1.3 (Ref #1)	1.3 (Ref #1)

DO NOT WRITE IN THIS SPACE

2. ANALYSIS METHOD - The slope stability program STABL is to be used as the method of analysis. (Ref 4-2) The program uses the simplified Janbu method of slices and the modified Bishop method of slices. The Janbu method generally gives more conservative results when compared to the Bishop method except for deep circular failure surfaces where the soil strength is defined mainly in terms of strength intercept (c or $\bar{c}$). It is recommend to use the Bishop method for circular failure surfaces (Ref 4-2, p 91, 100)

1. Circular Failure Surfaces - Use COMMAND CIRCL2 - Modified Bishop method of slices

2. Irregular or block/wedge surfaces - Use COMMAND CIRCLE - Simplified Janbu method of slices.

3. SOIL PARAMETERS

a) EMBANKMENT - (GENERAL FILL)

1. Angle of internal friction - ($\bar{\phi}$) -
The effective angle of internal friction as evaluated in Ref 3 & 4

$\bar{\phi} = 36°$

2. Design value unit weights selection ($\gamma_d, \gamma_m, \gamma_{sat}$) ASTM-D1557
The results from Client's moisture-density (Proctors) testing

	$\gamma_{dry\ MAX.}$ (lb/ft³)	w (%)
7+00	117.8	12.2
19+00	134	5.8
34+00	137	6.5

DO NOT WRITE IN THIS SPACE

From the above values select a maximum dry density of 135 lb/ft³

Choose a design value dry unit weight at 92% maximum

$$\gamma_d = 0.92(135) = 124.2 \Rightarrow \text{SELECT } \boxed{\gamma_d = 125 \text{ lb/ft}^3}$$

From the moisture-density relationships choose optimum moisture content of 6%

Select a design value moist unit weight

$$\gamma_m = 1.06(125) = 132.5 \Rightarrow \text{SELECT } \boxed{\gamma_m = 133 \text{ lb/ft}^3}$$

From REF #5 the results from laboratory testing

STATION	γ_{sat}	γ_{dry}
7+00	136.5 lb/ft³	117.5 lb/ft³
19+00	142.5 lb/ft³	133.5 lb/ft³
34+00	147 lb/ft³	133.5 lb/ft³

As noted in reference #5, the above values are not true saturated unit weights. The degree of saturation was less than 100% because the samples contained some amount of trapped air. The above values were determined by soaking proctor samples over a period of several days until there was no appreciable change in weight. There was no action taken to remove the trapped air.

Although this testing procedure was incorrect for determining saturated unit weight (entrained air not removed), it approximates field conditions fairly well.

DO NOT WRITE IN THIS SPACE

c) EMBANKMENT – (GENERAL FILL)

Select a design saturated unit weight from an average of Sta 19+00 & Sta. 34+00 percentage of weight increase

Sta. 19+00 $\%$ WT GAINED $= \frac{142.5 - 133.5}{133.5} = 6.74\%$

Sta. 34+00 $\%$ WT GAINED $= \frac{147 - 133.5}{133.5} = 10.11\%$

) AVG = 8.43%

With design dry weight $\Rightarrow \gamma_d = 125$ lb/ft^3

$\gamma_{sat} = 125(1.084) = 135.5 \Rightarrow$ Select $\boxed{\gamma_{sat} = 135 \text{ lb/ft}^3}$

In uniform soils such as certain types of SP and GP, $e_{max} - e_{min}$ is small and e_{min} is large; hence F is small, and the soil more difficult to compact. Table 7.3 lists compactibilities for a variety of soils.

Burmister (1948) showed that the relative density of noncohesive soils was a more significant parameter than dry density alone insofar as engineering properties of the soil are concerned. His work has been verified and extended by other investigators (D'Appolonia, 1970).

As indicated in Eqs. 7.3 and 7.4, determination of the relative density of a soil requires measuring its dry density in place, its dry density in the loosest state, and its dry density in the densest state (or the three corresponding void ratios). The density in place and minimum density (loosest state) present no particular difficulty, but a generally accepted method of determining the maximum density (densest state) of all cohesionless soils has not yet been found (see section 7.4).

TABLE 7.3. COMPACTIBILITY (F) OF COHESIONLESS SOILS (where $F = (e_{max} - e_{min})/e_{min}$).

SUMMARY TO DETERMINE THE SENSITIVITY OF ANALYSIS, THE SOIL PARAMETERS WILL BE VARIED AS FOLLOWS

GENERAL FILL

$\gamma_{max} = 126 - 133$ lb/ft^3, $\gamma_{sat} = 135$ lb/ft^3
$\bar{\phi} = 36^\circ - 32^\circ$, $\bar{c} = 0$

FILTER

$\gamma_m = 126$ lb/ft^3, $\gamma_{sat} = 135$ lb/ft^3
$\bar{\phi} = 34^\circ - 30^\circ$, $\bar{c} = 0$

NORTHERN FOUNDATION

SOIL #1 $\gamma_m = 105$ lb/ft^3, $\gamma_{sat} = 115$ lb/ft^3
$\bar{\phi} = 33^\circ - 30^\circ$, $\bar{c} = 0$

SOIL #2 $\gamma_m = 125$ lb/ft^3, $\gamma_{sat} = 135$ lb/ft^3
$\bar{\phi} = 36^\circ - 32^\circ$, $\bar{c} = 0$

SOUTHERN FOUNDATION

SOIL #1 $\gamma_m = 165$ lb/ft^3, $\gamma_s = 167$ lb/ft^3
$\bar{\phi} = 45^\circ - 41^\circ$, $\bar{c} = 2000$ lb

SOIL #2 $\gamma_m = 125$ lb/ft^3, $\gamma_s = 135$ lb/ft^3
$\bar{\phi} = 36^\circ - 32^\circ$, $\bar{c} = 0$

TABLE 5-2 REF #1

EMBANKMENT SLOPE STABILITY
MINIMUM FACTORS OR SAFETY 1/

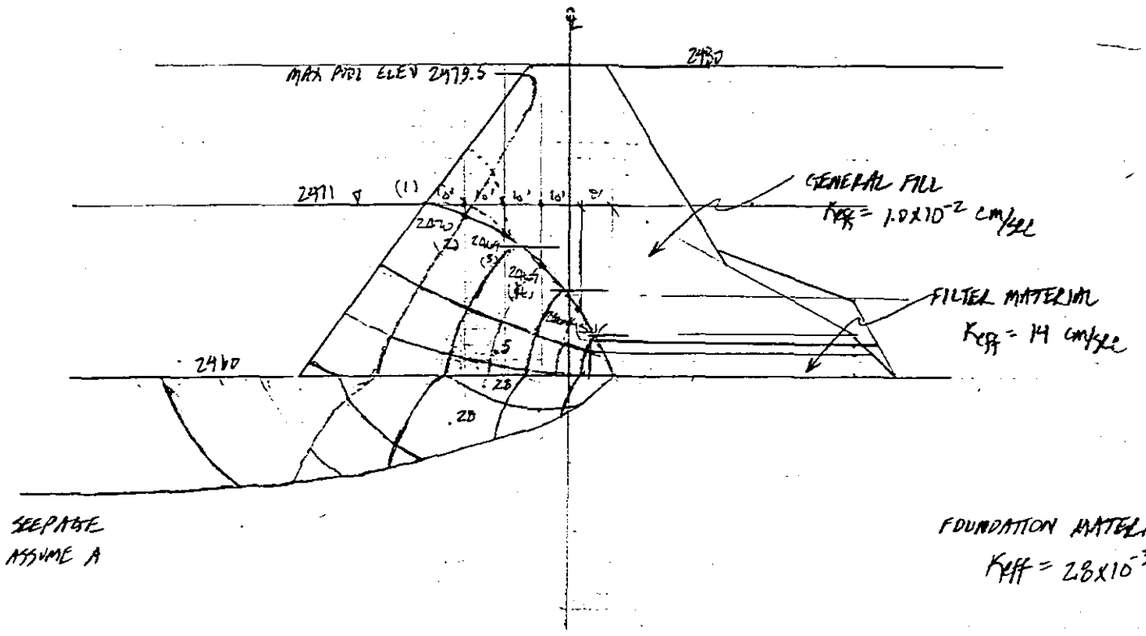
Loading Condition	Structure Classification	Factor of Safety	
		W/O Seismic 2/ + Forces	W/Seismic Forces
End of Construction	(a), (b) and (c)	1.4 3/	Not Applicable
Steady Seepage, Reservoir Elev. @ Highest Principal Spwy. Crest	(a)	1.4	1.0
	(b)	1.5	1.1
	(c)	1.5	1.1
Sudden Drawdown, Complete and/or Partial	(a), (b) and (c)	1.3 4/	Not Applicable

1/ Factor of safety is to be evaluated by an appropriate method.

2/ Factor of safety for an infinite slope analysis is to exceed 1.0 for class (a) and 1.1 for classes (b) and (c).

3/ A factor of 1.3 may be used for embankments on strong foundation where the limiting potential failure surface is entirely within the embankment.

4/ A factor of 1.2 may be used where the limiting potential failure surface is entirely within the embankment.



homogeneous earth dams and dams on thick deposits of fine-grained materials, whereas the wedge method is generally more applicable to rock-fill dams on firm foundations and to earth dams on foundations containing one or more weak layers. In addition, the infinite slope method is used to some extent to supplement the circular arc or wedge method. These methods provide a uniform basis for evaluating alternative designs and may be supplemented by other methods or alternative procedures at the discretion of the designer. The use of the modified Swedish method given in Appendix VI is optional. If desired, the forces on the vertical sides of slices may be ignored.

11. Design Conditions for Analysis. An embankment and its foundation are subjected to shear stresses imposed by the weight of the embankment and by pool fluctuations, seepage, or earthquake forces. The cases for which stability analyses shall be performed are designated (I) end of construction, (II) sudden drawdown from maximum pool, (III) sudden drawdown from spillway crest elevation, (IV) partial pool, (V) steady seepage with maximum storage pool, (VI) steady seepage with surcharge pool, and where applicable (VII) earthquake. Cases I and VII apply to both upstream and downstream slopes; Cases II, III, and IV apply to upstream slopes only; and Cases V and VI apply to downstream slopes.

a. Case I: End of Construction. In an embankment composed partially or entirely of impervious soils placed at water contents higher than those corresponding to ultimate water contents after complete consolidation under the imposed loading, pore pressure will be induced because the soil cannot consolidate readily during the construction period. Where this is indicated, applicable shear strengths are determined from Q tests on specimens compacted to anticipated field placement water contents and densities. The Q shear strength is also applicable to impervious foundation layers that are too thick to consolidate significantly during construction. The use of Q shear strengths implies that pore water pressures occurring in laboratory tests satisfactorily approximate field pore water pressures. Except for

percent of the rack-rated capacity. Where the design and rack configurations are in accordance with this paragraph, the design provisions in U.B.C. Standard No. 27-11 do not apply

[3]For flexible and flexibly mounted equipment and machinery, the appropriate values of C_p shall be determined with consideration given to both the dynamic properties of the equipment and machinery and to the building or structure in which it is placed but shall be not less than the listed values. The design of the equipment and machinery and their anchorage is an integral part of the design and specification of such equipment and machinery.

For essential facilities and life safety systems, the design and detailing of equipment which must remain in place and be functional following a major earthquake shall consider drifts in accordance with Section 2312 (k).

[4]Ceiling weight shall include all light fixtures and other equipment which is laterally supported by the ceiling. For purposes of determining the lateral force, a ceiling weight of not less than 4 pounds per square foot shall be used.

[5]The force shall be resisted by positive anchorage and not by friction.

[6]See also Section 2309 (b) for minimum load and deflection criteria for interior partitions.

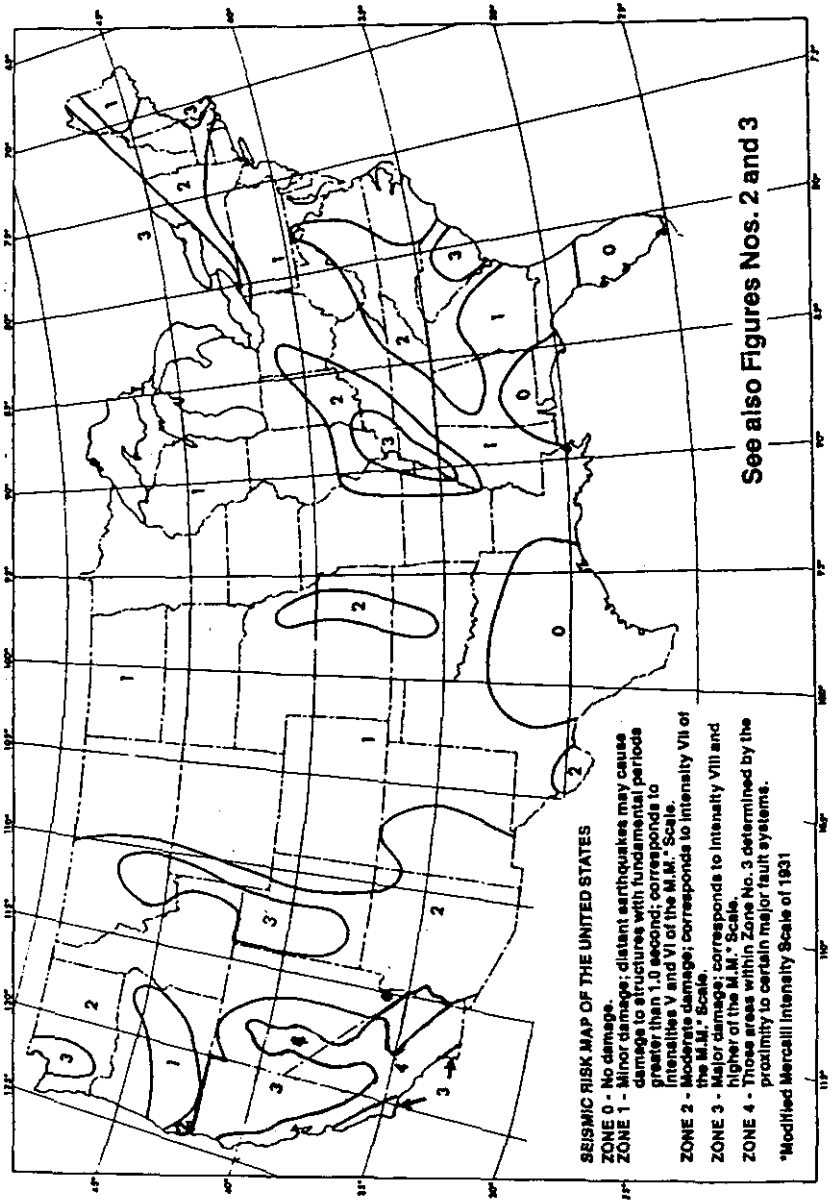
[7]Does not apply to ceilings constructed of lath and plaster or gypsum board screw or nail attached to suspended members that support a ceiling at one level extending from wall to wall.

[8]W_p for access floor systems shall be the dead load of the access floor system plus 25 percent of the floor live load and a 10 psf partition load.

TABLE NO. 23-K—VALUES FOR OCCUPANCY IMPORTANCE FACTOR I

TYPE OF OCCUPANCY	I
Essential facilities[1]	1.5
Any building where the primary occupancy is for assembly use for more than 300 persons (in one room)	1.25
All others	1.0

[1]See Section 2312 (k) for definition and additional requirements for essential facilities.



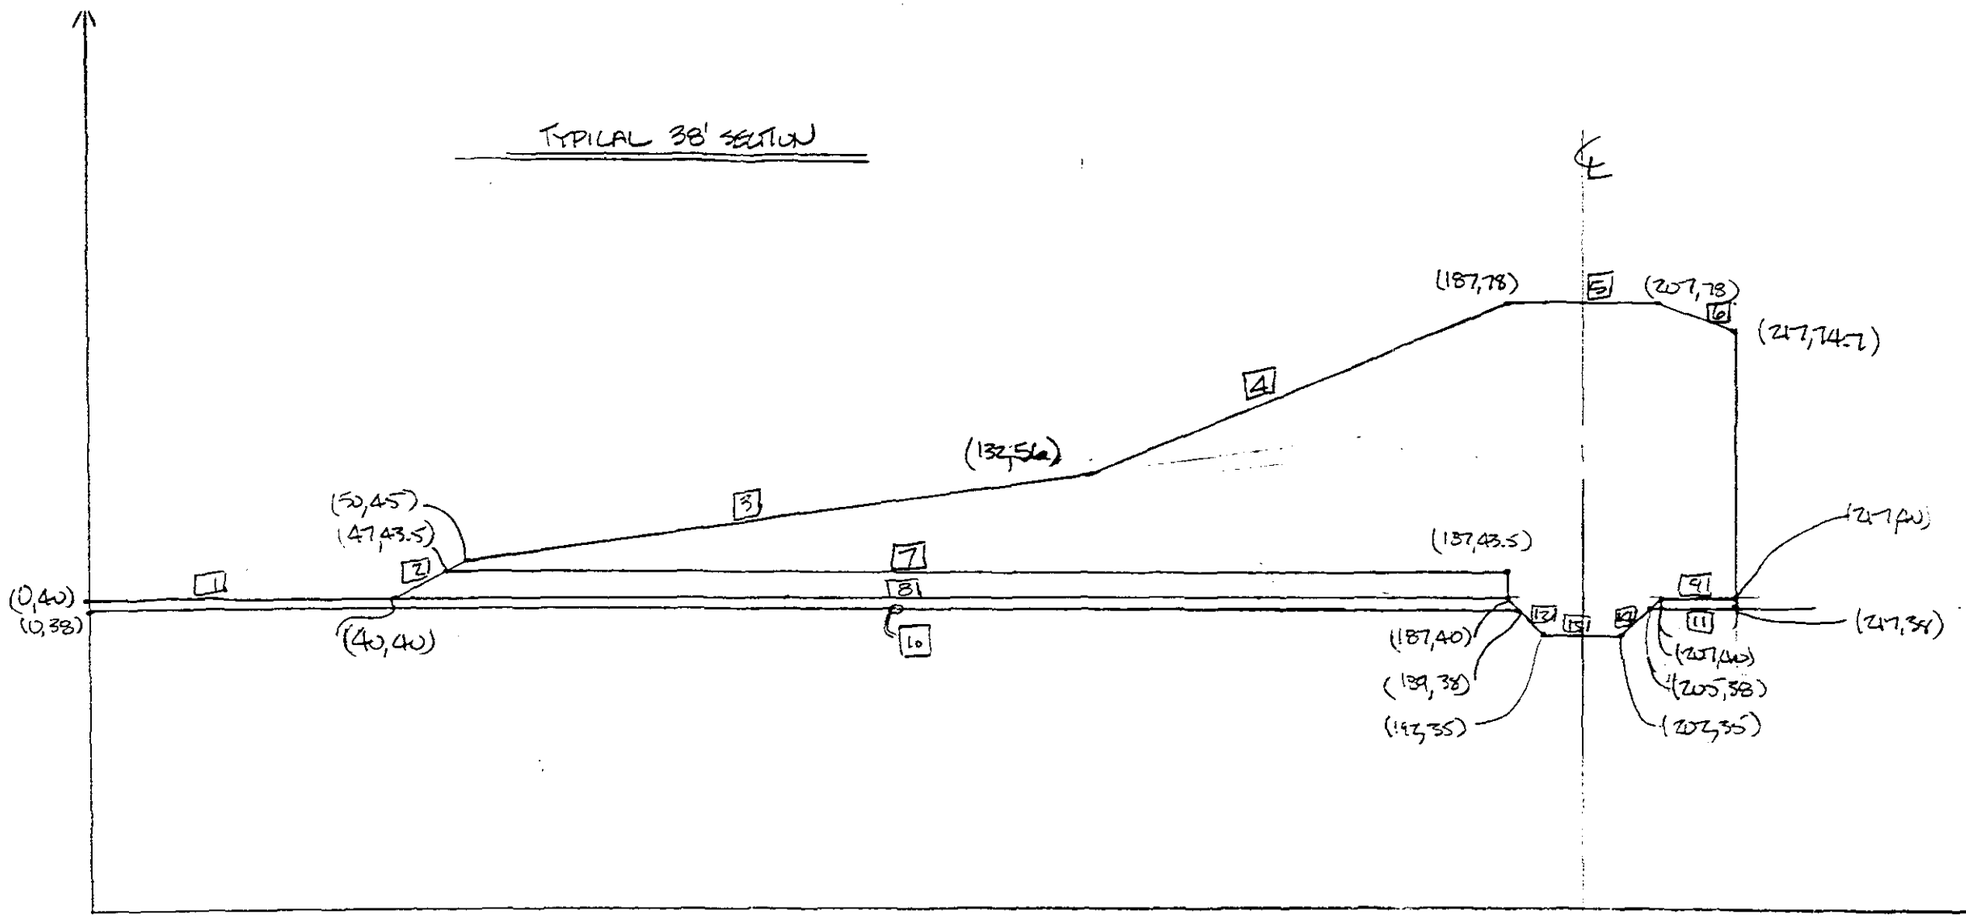


FIGURE NO. 1—SEISMIC ZONE MAP OF THE UNITED STATES
For areas outside of the United States, see Appendix Chapter 23

TABLE 12-1 The Modified Mercalli Intensity Scale and corresponding approximate ground accelerations.[12-8]

	Ground Acceleration a	
	cm/sec	a/g
I - Not felt except by a very few under especially favorable circumstances.		
II - Felt only by a few persons at rest, especially on upper floors of buildings. Delicately suspended objects may swing.	2	
	3	
III - Felt quite noticeably indoors, especially on upper floors of buildings, but many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibration like passing truck. Duration estimated.	4	
	5	.005g
	6	
IV - During the day felt indoors by many, outdoors by few. At night some awakened. Dishes, windows, doors disturbed; walls make creaking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.	7	
	8	
	9	.01g
	10	
V - Felt by nearly everyone; many awakened. Some dishes, windows, etc., broken; a few instances of cracked plaster; unstable objects overturned. Disturbances of trees, poles, and other tall objects sometimes noticed. Pendulum clocks may stop.	20	
	30	
VI - Felt by all; many frightened and run outdoors. Some heavy furniture moved; a few instances of fallen plaster or damaged chimneys. Damage slight.	40	
	50	.05g
	60	
VII - Everybody runs outdoors. Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable in poorly built or badly designed structures; some chimneys broken. Noticed by persons driving motor cars.	70	
	80	
	90	
	100	0.1g
VIII - Damage slight in specially designed structures; considerable in ordinary substantial buildings, with partial collapse; great in poorly built structures. Panel walls thrown out of frame structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned. Sand and mud ejected in small amounts. Changes in well water. Disturbs persons driving motor cars.	200	
	300	
IX - Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb; great in substantial buildings, with partial collapse. Buildings shifted off foundations. Ground cracked conspicuously. Underground pipes broken.	400	
	500	0.5g
	600	
X - Some well-built, wooden structures destroyed; most masonry and frame structures destroyed with foundations; ground badly cracked. Rails bent. Landslides considerable from river banks and steep slopes. Shifted sand and mud. Water splashed over banks.	700	
	800	
	900	
	1000	1g
XI - Few, if any, (masonry) structures remain standing. Bridges destroyed. Broad fissures in ground. Underground pipelines completely out of service. Earth slumps and land slips in soft ground. Rails bent greatly.	2000	
	3000	
XII - Damage total. Waves seen on ground surfaces. Lines of sight and level distorted. Objects thrown upward into the air.	4000	
	5000	5g
	6000

DWSTRM SLOPE STABILITY, 20' TYP. SECTION, EARTHQUAKE, MOIST SOIL

A CRITICAL FAILURE SURFACE SEARCHING METHOD, USING A RANDOM
TECHNIQUE FOR GENERATING CIRCULAR SURFACES, HAS BEEN SPECIFIED.

100 TRIAL SURFACES HAVE BEEN GENERATED.

10 SURFACES INITIATE FROM EACH OF 10 POINTS EQUALLY SPACED
ALONG THE GROUND SURFACE BETWEEN X = 0.00 FT.
AND X = 90.00 FT.

EACH SURFACE TERMINATES BETWEEN X = 110.00 FT.
AND X = 145.00 FT.

UNLESS FURTHER LIMITATIONS WERE IMPOSED, THE MINIMUM ELEVATION
AT WHICH A SURFACE EXTENDS IS Y = 0.00 FT.

10.00 FT. LINE SEGMENTS DEFINE EACH TRIAL FAILURE SURFACE.

DWSTRM SLOPE STABILITY, 20' TYP. SECTION, EARTHQUAKE, MOIST SOIL

FOLLOWING ARE DISPLAYED THE TEN MOST CRITICAL OF THE TRIAL SURFACES EXAMINED.
THEY ARE ORDERED MOST CRITICAL FIRST.

DWSTRM SLOPE STABILITY, 20' TYP. SECTION, EARTHQUAKE, MOIST SOIL

A CRITICAL FAILURE SURFACE SEARCHING METHOD, USING A RANDOM
TECHNIQUE FOR GENERATING CIRCULAR SURFACES, HAS BEEN SPECIFIED.

100 TRIAL SURFACES HAVE BEEN GENERATED.

10 SURFACES INITIATE FROM EACH OF 10 POINTS EQUALLY SPACED
ALONG THE GROUND SURFACE BETWEEN X = 0.00 FT.
AND X = 90.00 FT.

EACH SURFACE TERMINATES BETWEEN X = 110.00 FT.
AND X = 145.00 FT.

UNLESS FURTHER LIMITATIONS WERE IMPOSED, THE MINIMUM ELEVATION
AT WHICH A SURFACE EXTENDS IS Y = 0.00 FT.

10.00 FT. LINE SEGMENTS DEFINE EACH TRIAL FAILURE SURFACE.

DWSTRM SLOPE STABILITY, 20' TYP. SECTION, EARTHQUAKE, MOIST SOIL

FOLLOWING ARE DISPLAYED THE TEN MOST CRITICAL OF THE TRIAL SURFACES EXAMINED.
THEY ARE ORDERED MOST CRITICAL FIRST.

DWSTRM SLOPE STABILITY, 20' TYP. SECTION, EARTHQUAKE, MOIST SOIL

DWSTRM SLOPE STABILITY, 20' TYP. SECTION, EARTHQUAKE, MOIST SOIL

A CRITICAL FAILURE SURFACE SEARCHING METHOD, USING A RANDOM TECHNIQUE FOR GENERATING SLIDING BLOCK SURFACES, HAS BEEN SPECIFIED.

THE ACTIVE AND PASSIVE PORTIONS OF THE SLIDING SURFACES ARE GENERATED ACCORDING TO THE RANKINE THEORY.

10 TRIAL SURFACES HAVE BEEN GENERATED.

2 BOXES SPECIFIED FOR GENERATION OF CENTRAL BLOCK BASE

LENGTH OF LINE SEGMENTS FOR ACTIVE AND PASSIVE PORTIONS OF SLIDING BLOCK IS 5.0

BOX NO.	X-LEFT (FT)	Y-LEFT (FT)	X-RIGHT (FT)	Y-RIGHT (FT)	WIDTH (FT)
1	60.00	81.00	80.00	81.00	2.00
2	95.00	81.00	115.00	81.00	2.00

DWSTRM SLOPE STABILITY, 20' TYP. SECTION, EARTHQUAKE, MOIST SOIL

FOLLOWING ARE DISPLAYED THE TEN MOST CRITICAL OF THE TRIAL SURFACES EXAMINED.
THEY ARE ORDERED MOST CRITICAL FIRST.

* * * SAFETY FACTORS ARE CALCULATED BY THE MODIFIED JANBU METHOD* * *.

A HORIZONTAL EARTHQUAKE LOADING COEFFICIENT
OF0.100 HAS BEEN ASSIGNED

A VERTICAL EARTHQUAKE LOADING COEFFICIENT
OF0.000 HAS BEEN ASSIGNED

CAVITATION PRESSURE = 2116.8 PSF

DWSTRM SLOPE STABILITY, 38' TYP. SECTION, EARTHQUAKE, MOIST SOIL

A CRITICAL FAILURE SURFACE SEARCHING METHOD, USING A RANDOM
TECHNIQUE FOR GENERATING IRREGULAR SURFACES, HAS BEEN SPECIFIED.

100 TRIAL SURFACES HAVE BEEN GENERATED.

10 SURFACES INITIATE FROM EACH OF 10 POINTS EQUALLY SPACED
ALONG THE GROUND SURFACE BETWEEN X = 0.00 FT.
AND X = 140.00 FT.

EACH SURFACE TERMINATES BETWEEN X = 170.00 FT.
AND X = 217.00 FT.

UNLESS FURTHER LIMITATIONS WERE IMPOSED, THE MINIMUM ELEVATION
AT WHICH A SURFACE EXTENDS IS Y = 0.00 FT.

10.00 FT. LINE SEGMENTS DEFINE EACH TRIAL FAILURE SURFACE.

DWSTRM SLOPE STABILITY, 38' TYP. SECTION, EARTHQUAKE, MOIST SOIL

FACTOR OF SAFETY CALCULATION HAS GONE THROUGH TEN ITERATIONS

THE TRIAL FAILURE SURFACE IN QUESTION IS DEFINED
BY THE FOLLOWING 11 COORDINATE POINTS

POINT NO.	X-SURF (FT)	Y-SURF (FT)
1	140.00	59.20
2	147.32	52.38
3	154.69	45.63
4	162.34	39.18

DWSTRM SLOPE STABILITY, 38' TYP. SECTION, EARTHQUAKE, MOIST SOIL

DWSTRM SLOPE STABILITY, 38' TYP. SECTION, EARTHQUAKE, MOIST SOIL

A CRITICAL FAILURE SURFACE SEARCHING METHOD, USING A RANDOM
TECHNIQUE FOR GENERATING IRREGULAR SURFACES, HAS BEEN SPECIFIED.

100 TRIAL SURFACES HAVE BEEN GENERATED.

10 SURFACES INITIATE FROM EACH OF 10 POINTS EQUALLY SPACED
ALONG THE GROUND SURFACE BETWEEN X = 0.00 FT.
AND X = 140.00 FT.

EACH SURFACE TERMINATES BETWEEN X = 170.00 FT.
AND X = 217.00 FT.

UNLESS FURTHER LIMITATIONS WERE IMPOSED, THE MINIMUM ELEVATION
AT WHICH A SURFACE EXTENDS IS Y = 0.00 FT.

10.00 FT. LINE SEGMENTS DEFINE EACH TRIAL FAILURE SURFACE.

DWSTRM SLOPE STABILITY, 38' TYP. SECTION, EARTHQUAKE, MOIST SOIL

FOLLOWING ARE DISPLAYED THE TEN MOST CRITICAL OF THE TRIAL SURFACES EXAMINED.
THEY ARE ORDERED MOST CRITICAL FIRST.

* * * SAFETY FACTORS ARE CALCULATED BY THE MODIFIED JANBU METHOD* * *.

PURPOSE: Determine if the embankment section is stable against sliding ($F.S._{resis} \geq 1.5$), overturning ($F_{resis} > 1.5$ to 2)

REFERENCES

(1) "VECTOR MECHANICS FOR ENGINEERS—STATICS", BEER & JOHNSTON, 1977
(2) "PRINCIPLES OF FOUNDATION ENGINEERING", DAS, 1984
(3)

PROCEDURE:

TRY TYPICAL 35' SECTION WITH IMPERMEABLE CALICHE LAYER BENEATH EMBANKMENT

P_w = hydrostatic force
W_e = weight of embankment
F = friction force
N = normal force
U = uplift force
W_w = weight of water

$[\Sigma F_x = 0] \Rightarrow P_{wx} = F \Rightarrow P_{wx} = \mu N$

$[\Sigma F_y = 0]$ $P_{wy} + W_e + W_w = U + N$

P-GN-024-A

DO NOT WRITE IN THIS SPACE

DETERMINE LOADS FOR UNIT LENGTH OF EMBANKMENT

$P_w = \frac{1}{2}(34.5\,ft)(34.5\,ft)(1\,ft)(62.4\,lb/ft^3) = 37.1\,k \rightarrow$ ✓

$W_w = (34.5\,ft)(10.5\,ft)(1\,ft)(1/2)(62.4\,lb/ft^3) = 113^k \downarrow$ ✓

W_e = (assume ave $\gamma = 130\,lb/ft^3$) ✓

$= (130\,lb/ft^3)(1\,ft)\left[(35\,ft)(10.5\,ft)(\tfrac{1}{2}) + (12\,ft)(39\,ft) + \left(\frac{3.5\,ft + 15.5\,ft}{2}\right)(50\,ft) + \left(\frac{15.5\,ft + 5\,ft}{2}\right)(75\,ft) + \tfrac{1}{2}(5\,ft)(10\,ft)\right] = 547.2^k \downarrow$ ✓

DETERMINE S.F. AGAINST SLIDING IF UPLIFT ASSUMED ZERO

$[\Sigma F_y = 0] \Rightarrow \quad W_e + W_w = N \Rightarrow \quad 547.2^k + 113^k \Rightarrow N = 710.3^k$ ✓

$[\Sigma F_x = 0] \quad P_w = \mu N \quad \left[S.F. = \frac{\mu N}{P_w}\right]$ ✓

REF #1 (Pg 306) Coefficient of static friction on dry surfaces

EARTH ON EARTH 0.40 – 0.70
$\phi = 25° \text{ to } 35°$

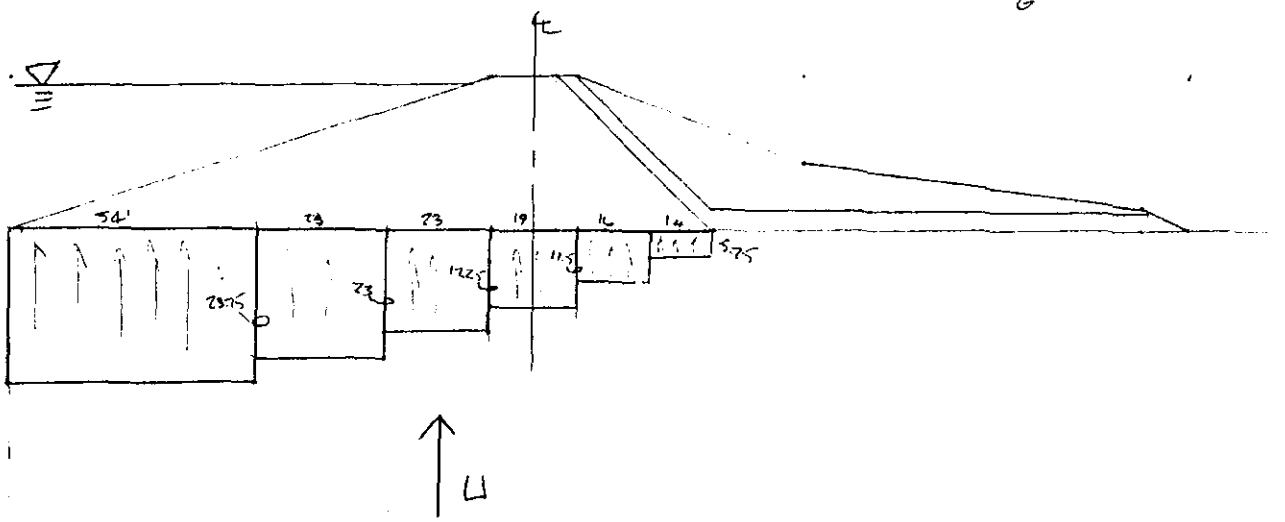
Let wet earth on concrete $\mu = 0.10$ $\phi = 6°$

$S.F._{\text{sliding}} = \frac{0.10\,(710.3^k)}{37.1^k} \Rightarrow$ **S.F. ≃ 1.9 sliding** ✓ assuming zero uplift forces

REF #2 – Coefficient of wall friction ranges ½ to ⅔ ϕ
for concrete to sandy soil
with $\phi = 36°$, friction angle $= \frac{1}{2}(36) = 18°$

$\mu = \tan(18°) = 0.32$ ✓

P-GN-024-A



DO NOT WRITE IN THIS SPACE

$S.F._{\text{sliding}} = \dfrac{0.32(7103^k)}{37.1^k} \Rightarrow \boxed{S.F. = 6.1} > 1.5$ OK

DETERMINE S.F. AGAINST SLIDING IF UPLIFT CONSIDERED

Estimate uplift forces

There was no flownet drawn for a typical 35' section, but a good estimate can be made from the flownet constructed for a typical 40' section. $N_{drops} = 6$ $\Delta H = \frac{34.5}{6} = 5.75'$

$U = (62.4^{\#}/ft^3)(1ft)[34.5(54) + 21.75(24) + 23(23) + 17.25(19) + 11.5(16) + 5.75(14)]$

$U = 236.4^k$

$[\Sigma F_y = 0]$ $\quad W_c + W_w - U = N \Rightarrow$ $\quad 547.2^k + 113^k - 236.4^k = N$

$N = 423.8^k$

$[\Sigma F_x = 0]$ with $\mu = 0.32$ $\quad S.F. = \dfrac{423.8^k(0.32)}{37.1^k} = 4.1 > 1.5$ OK

with $\mu = 0.10$ $\quad S.F. = \dfrac{423.8^k(0.1)}{37.1^k} = 1.3 < 1.5$ close enough

SUMMARY – UPSTREAM SLOPE STABILITY ANALYSIS

The following is a brief summary of the upstream embankment slope stability analysis.

EMBANKMENT CROSS-SECTION

A typical 40' high embankment with 3:1 upstream side slopes was analyzed

DESIGN CASES

There were three design cases considered:

(1) Rapid drawdown

- CASE "A" – Max. PMF pool elevation (2474.5') to empty basin
- CASE "B" – Max. PMF pool elevation to emergency spillway crest elevation 2471'
- CASE "C" – MAX. PMF pool elevation to intermediate pool elevation 2460'

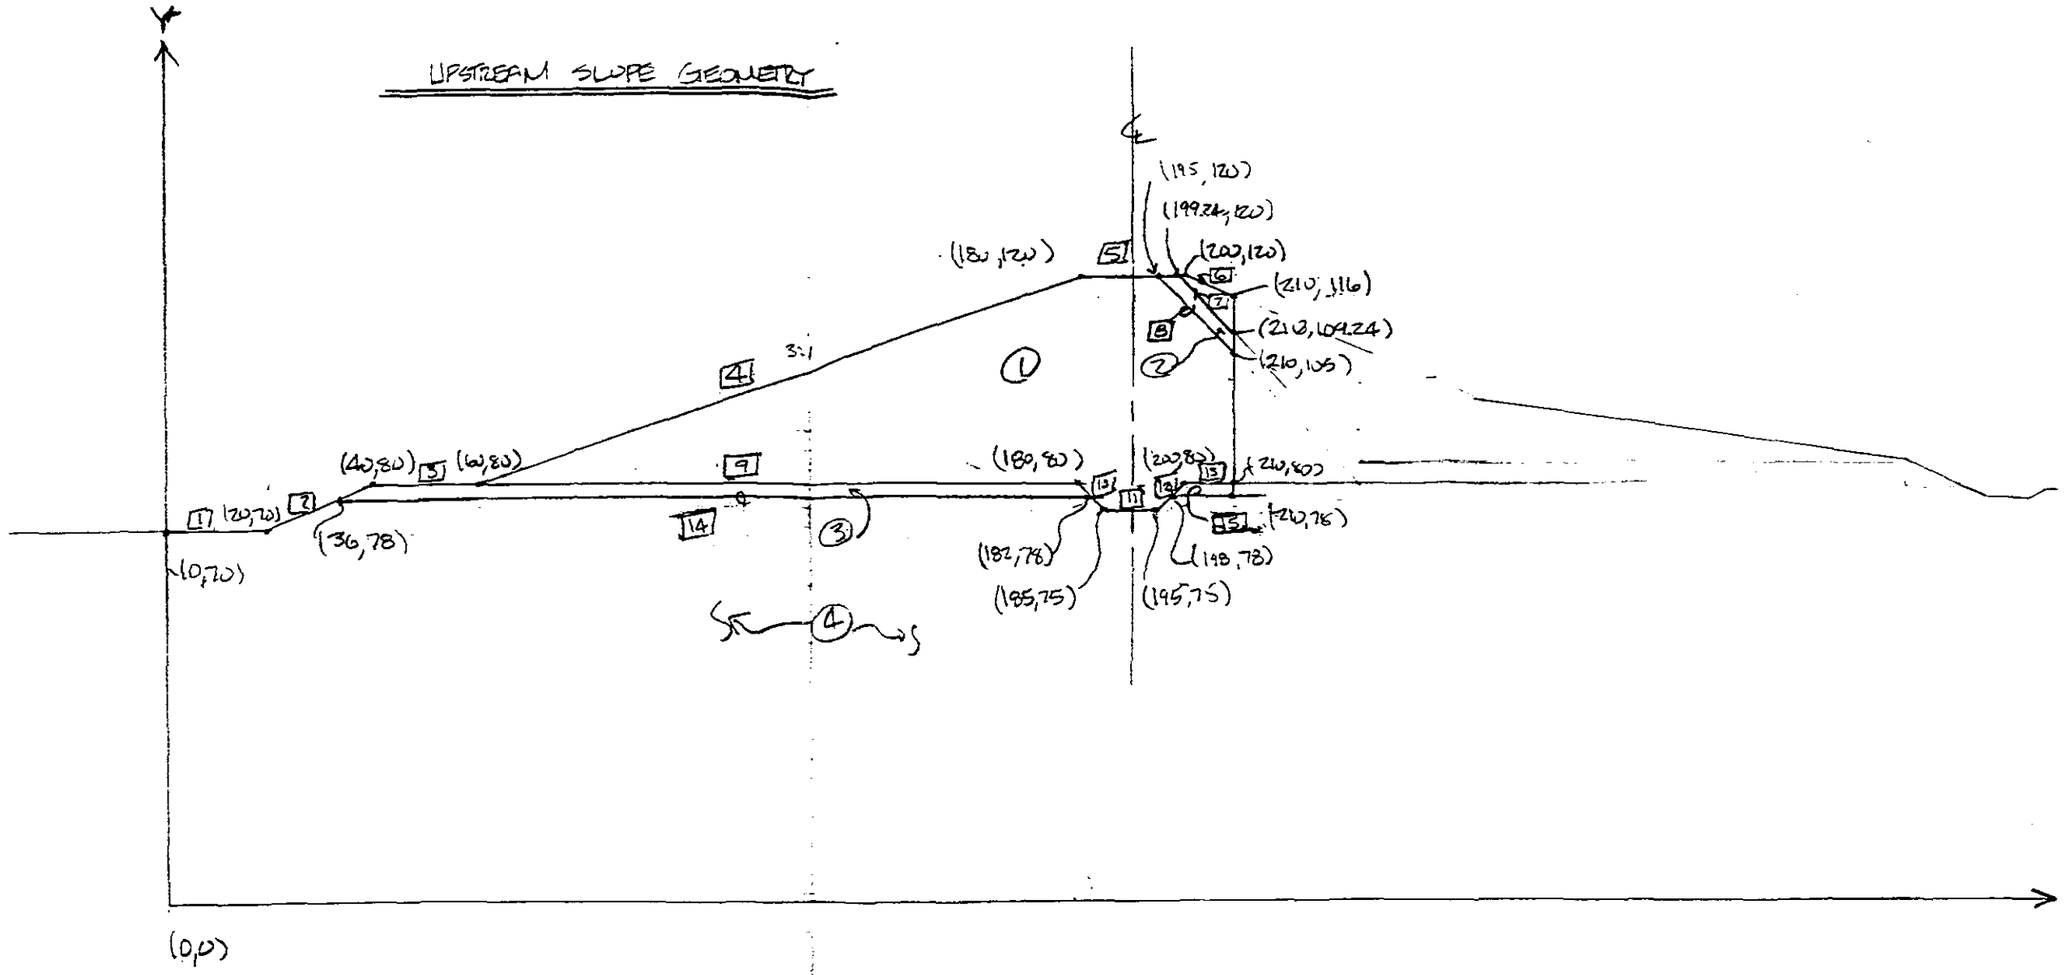
(2) End of construction

(3) Earthquake (Hor. + 0.1g M.M. VII, Zone 2, UBC-1985) with moist soil unit weights and empty basin

Analysis Method

The computer program STABL was used in the slope-stability analysis. The program calculates factors of safety for circular failure surfaces using the Modified Bishop method. Wide ranging limits were set for the critical failure surface search. Ten trial surface locations were equally spaced between the initiation and termination search limits and at each trial surface location, ten failure surfaces were generated.

Analysis Results



The upstream embankment slope proved to be stable against the rapid drawdown, end of construction, and earthquake design cases. The factor of safety all exceeded the required factors of safety as outlined in SCS's "Earth and Rockfill Dams", TR-60. (see the following summary sheets)

A CRITICAL FAILURE SURFACE SEARCHING METHOD, USING A RANDOM TECHNIQUE FOR GENERATING CIRCULAR SURFACES, HAS BEEN SPECIFIED.

100 TRIAL SURFACES HAVE BEEN GENERATED.

10 SURFACES INITIATE FROM EACH OF 10 POINTS EQUALLY SPACED ALONG THE GROUND SURFACE BETWEEN X = 0.00 FT.
AND X = 100.00 FT.

EACH SURFACE TERMINATES BETWEEN X = 160.00 FT.
AND X = 200.00 FT.

UNLESS FURTHER LIMITATIONS WERE IMPOSED, THE MINIMUM ELEVATION AT WHICH A SURFACE EXTENDS IS Y = 0.00 FT.

10.00 FT. LINE SEGMENTS DEFINE EACH TRIAL FAILURE SURFACE.

OF0.000 HAS BEEN ASSIGNED

CAVITATION PRESSURE = 2116.8 PSF

UPSTREAM SLOPE STABILITY, TYPICAL 40' HIGH EMBANKMENT SE

A CRITICAL FAILURE SURFACE SEARCHING METHOD, USING A RANDOM TECHNIQUE FOR GENERATING CIRCULAR SURFACES, HAS BEEN SPECIFIED.

100 TRIAL SURFACES HAVE BEEN GENERATED.

10 SURFACES INITIATE FROM EACH OF 10 POINTS EQUALLY SPACED ALONG THE GROUND SURFACE BETWEEN X = 0.00 FT.
AND X = 100.00 FT.

EACH SURFACE TERMINATES BETWEEN X = 160.00 FT.
AND X = 200.00 FT.

UNLESS FURTHER LIMITATIONS WERE IMPOSED, THE MINIMUM ELEVATION AT WHICH A SURFACE EXTENDS IS Y = 0.00 FT.

10.00 FT. LINE SEGMENTS DEFINE EACH TRIAL FAILURE SURFACE.

UPSTREAM SLOPE STABILITY, TYPICAL 40' HIGH EMBANKMENT SE

FOLLOWING ARE DISPLAYED THE TEN MOST CRITICAL OF THE TRIAL SURFACES EXA
THEY ARE ORDERED MOST CRITICAL FIRST.

UPSTREAM SLOPE STABILITY, TYPICAL 40' HIGH EMBANKMENT SECTION, END CONSTRUCT.

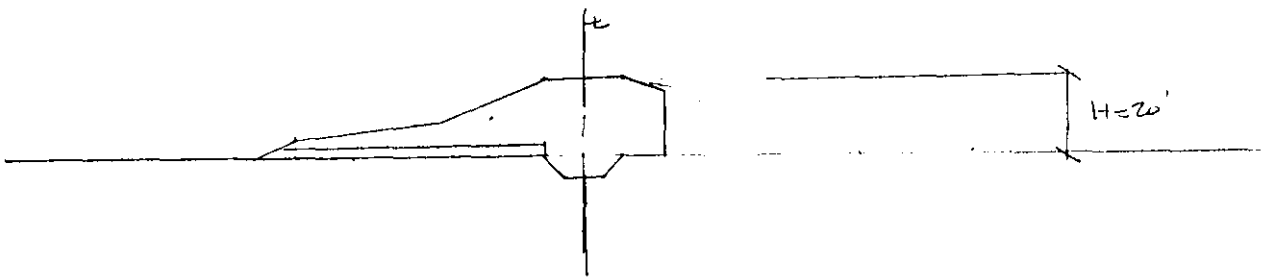
DO NOT WRITE IN THIS SPACE

PURPOSE: THE FOLLOWING IS A BRIEF SUMMARY OF THE DOWNSTREAM SLOPE-STABILITY ANALYSIS (FINAL



EMBANKMENT CROSS-SECTIONS

THERE WERE TWO EMBANKMENT CROSS-SECTIONS SELECTED FOR ANALYSIS

(1) A TYPICAL 38' HIGH EMBANKMENT SECTION WITH A 3'-6" THICK BLANKET DRAIN. GROUND SURFACE WAS ASSUMED TO BE LEVEL.

(2) A TYPICAL 20' HIGH EMBANKMENT SECTION WITH A 2'-0 THICK BLANKET DRAIN. GROUND SURFACE WAS ASSUMED TO BE LEVEL.

DESIGN LOADING CONDITIONS

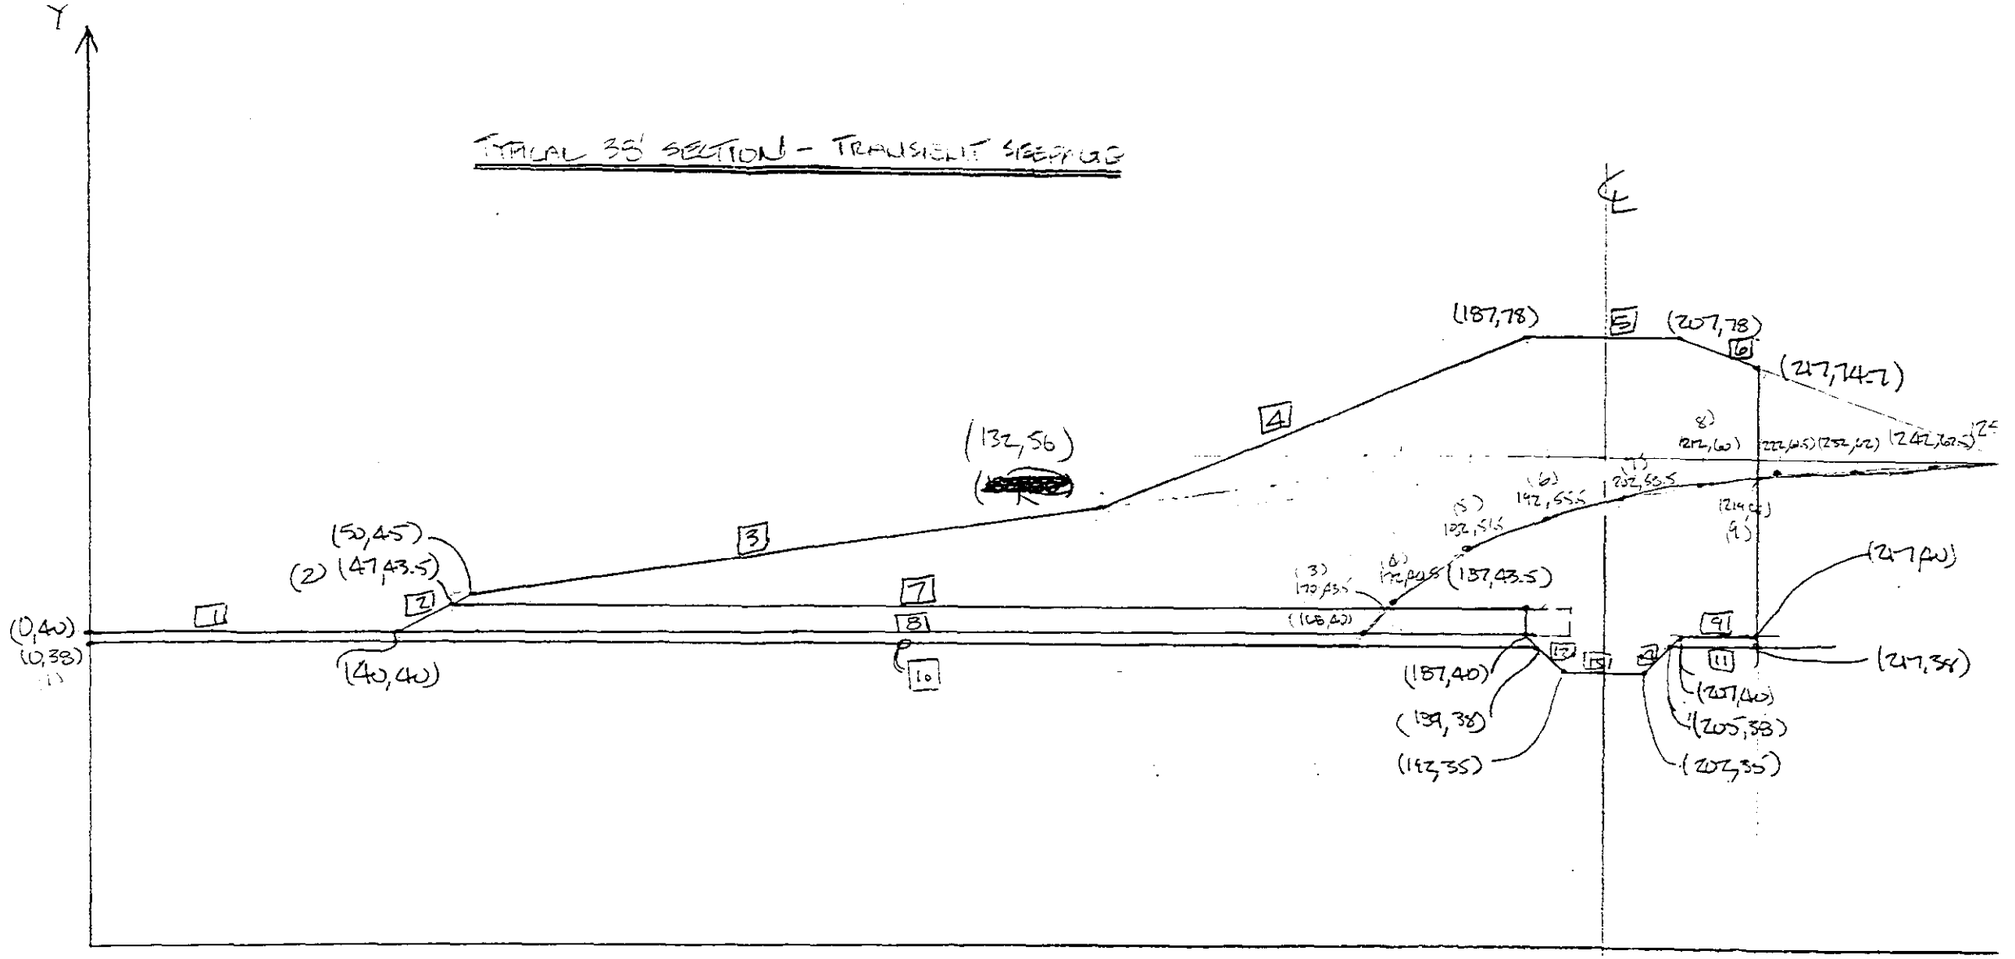
THERE WERE THREE DESIGN LOADING CONDITIONS APPLICABLE FOR THE DOWNSTREAM SLOPE STABILITY.

(1) A TRANSIENT SEEPAGE ANALYSIS WAS PERFORMED FOR THE PMF EVENT. THIS ANALYSIS PROVIDED THE CONTINUOUS FLOWNETS FROM WHICH THE PHREATIC "LINE OF SEEPAGE" COULD BE DETERMINED. (SEE ADDITIONAL CALCULATIONS AND DISCUSSION IN THIS CALCULATION BOOK ON TRANSIENT SEEPAGE ANALYSIS)

DO NOT WRITE IN THIS SPACE

(1) THE DOWNSTREAM SLOPE STABILITY WAS NOT EVALUATED FOR SEEPAGE AT THE LOW RESERVOIR POOL ELEVATION SINCE THE PMF EVENT CLEARLY CONTROLS.

(2) PSEUDO-STATIC EARTHQUAKE LOADING WAS CONSIDERED. THE BASIN WAS ASSUMED TO BE EMPTY. (SEE ADDITIONAL CALCULATIONS AND DISCUSSION ON EARTHQUAKE LOADING DESIGN PARAMETERS IN THIS CALC. BOOK)



(3) END OF CONSTRUCTION (SEE CALC'S AND DISCUSSION IN THIS NOTEBOOK)

ANALYSIS METHODS

THE SLOPE STABILITY PROGRAM STABL WAS USED FOR ANALYSIS. VARIOUS FAILURE SURFACES WERE SELECTED: CIRCULAR, IRREGULAR, AND BLOCK. STABL CALCULATES S.F.'S FOR CIRCULAR FAILURE SURFACES BY USING THE MODIFIED BISHOP METHOD. IRREGULAR AND BLOCK FAILURE SURFACES S.F.'S, WERE CALCULATED USING THE SIMPLIFIED JANBU METHOD OF SLICES. SOIL PARAMETERS WERE VARIED IN THE ANALYSIS TO DETERMINE THE SENSITIVITY OF THE SLOPE STABILITY PROGRAM.

ANALYSIS RESULTS

DETERMINE THE FLOWRATE OF SEEPAGE THROUGH THE MAXIMUM EMBANKMENT SECTION FOR THE TRANSIENT CONDITION OF THE PMF INFLOW HYDROGRAPH AT TIME = 14.85 HR AND POOL ELEVATION = 2465. THIS FLOWRATE WILL BE USED TO SIZE THE DRAINAGE BLANKET

FLOWRATE OF SEEPAGE

$$Q = K_{eff} h \frac{n_f}{n_d}$$

$$= (1.0 \times 10^{-2} \text{ cm/sec})(23 \text{ ft})\left(\frac{2.78}{4}\right) \quad (2.0 \times 10^{-2} \text{ ft/min})$$

$$= .32 \text{ ft}^3/\text{min} / \text{ft of dam}$$

$$\frac{\tan \beta}{\tan \alpha} = \frac{K_{comb}}{K_{fdn}} = 3.57$$

$$\frac{S}{d} = \frac{K_{fdn}}{K_{comb}} = .28$$

SEEPAGE IN FLOW CHANNEL IN FDN

$$Q_{FDN} = Q_{EMB}\left(\frac{K_{FDN}}{K_{EMB}}\right)$$

$$= Q_{EMB}\left(\frac{1.0 \times 10^{-2}}{2.8 \times 10^{-3}}\right)$$

$$= \frac{Q_{EMB}}{3.57}$$

$$= .28\, Q_{EMB}$$

DWSTRM SLOPE STABILITY, 38' TYP. SECTION, TRANSIENT SEEPAGE CONDITION

A CRITICAL FAILURE SURFACE SEARCHING METHOD, USING A RANDOM
TECHNIQUE FOR GENERATING CIRCULAR SURFACES, HAS BEEN SPECIFIED.

100 TRIAL SURFACES HAVE BEEN GENERATED.

10 SURFACES INITIATE FROM EACH OF 10 POINTS EQUALLY SPACED
ALONG THE GROUND SURFACE BETWEEN X = 0.00 FT.
AND X = 140.00 FT.

EACH SURFACE TERMINATES BETWEEN X = 170.00 FT.
AND X = 217.00 FT.

UNLESS FURTHER LIMITATIONS WERE IMPOSED, THE MINIMUM ELEVATION
AT WHICH A SURFACE EXTENDS IS Y = 0.00 FT.

10.00 FT. LINE SEGMENTS DEFINE EACH TRIAL FAILURE SURFACE.

DWSTRM SLOPE STABILITY, 38' TYP. SECTION, TRANSIENT SEEPAGE CONDITION

FOLLOWING ARE DISPLAYED THE TEN MOST CRITICAL OF THE TRIAL SURFACES EXAMINED.
THEY ARE ORDERED MOST CRITICAL FIRST.

* * * SAFETY FACTORS ARE CALCULATED BY THE MODIFIED BISHOP METHOD* * *.

DWSTRM SLOPE STABILITY, 38' TYP. SECTION, TRANSIENT SEEPAGE CONDITION

A CRITICAL FAILURE SURFACE SEARCHING METHOD, USING A RANDOM
TECHNIQUE FOR GENERATING CIRCULAR SURFACES, HAS BEEN SPECIFIED.

100 TRIAL SURFACES HAVE BEEN GENERATED.

10 SURFACES INITIATE FROM EACH OF 10 POINTS EQUALLY SPACED
ALONG THE GROUND SURFACE BETWEEN X = 0.00 FT.
AND X = 140.00 FT.

EACH SURFACE TERMINATES BETWEEN X = 170.00 FT.
AND X = 217.00 FT.

UNLESS FURTHER LIMITATIONS WERE IMPOSED, THE MINIMUM ELEVATION
AT WHICH A SURFACE EXTENDS IS Y = 0.00 FT.

10.00 FT. LINE SEGMENTS DEFINE EACH TRIAL FAILURE SURFACE.

>>>>> WARNING: MORE THAN 6 PLOTS HAVE BEEN DRAWN. NEXT PLOT SHEET HAS BEEN STARTED.

DWSTRM SLOPE STABILITY, 38' TYP. SECTION, TRANSIENT SEEPAGE CONDITION

FOLLOWING ARE DISPLAYED THE TEN MOST CRITICAL OF THE TRIAL SURFACES EXAMINED.

DWSTRM SLOPE STABILITY, 20' TYP. SECTION, TRANSIENT SEEPAGE CONDITION

A CRITICAL FAILURE SURFACE SEARCHING METHOD, USING A RANDOM
TECHNIQUE FOR GENERATING CIRCULAR SURFACES, HAS BEEN SPECIFIED.

100 TRIAL SURFACES HAVE BEEN GENERATED.

10 SURFACES INITIATE FROM EACH OF 10 POINTS EQUALLY SPACED
ALONG THE GROUND SURFACE BETWEEN X = 0.00 FT.
AND X = 90.00 FT.

EACH SURFACE TERMINATES BETWEEN X = 110.00 FT.
AND X = 145.00 FT.

UNLESS FURTHER LIMITATIONS WERE IMPOSED, THE MINIMUM ELEVATION
AT WHICH A SURFACE EXTENDS IS Y = 0.00 FT.

10.00 FT. LINE SEGMENTS DEFINE EACH TRIAL FAILURE SURFACE.

DWSTRM SLOPE STABILITY, 20' TYP. SECTION, TRANSIENT SEEPAGE CONDITION

FOLLOWING ARE DISPLAYED THE TEN MOST CRITICAL OF THE TRIAL SURFACES EXAMINED.
THEY ARE ORDERED MOST CRITICAL FIRST.

PURPOSE: DEFINE "END OF CONSTRUCTION" SLOPE-STABILITY DESIGN CRITERIA AND ANALYSIS PROCEDURES FOR THE DOWNSTREAM SLOPE.

REFERENCES:

(1) PHC CALC'S DATED 11/22/93 — END OF CONSTRUCTION UPSTREAM SLOPE STABILITY CRITERIA
(2) "SEEPAGE, DRAINAGE, AND FLOWNETS", CEDERGREN, WILEY & SONS, 1967

PROCEDURE:

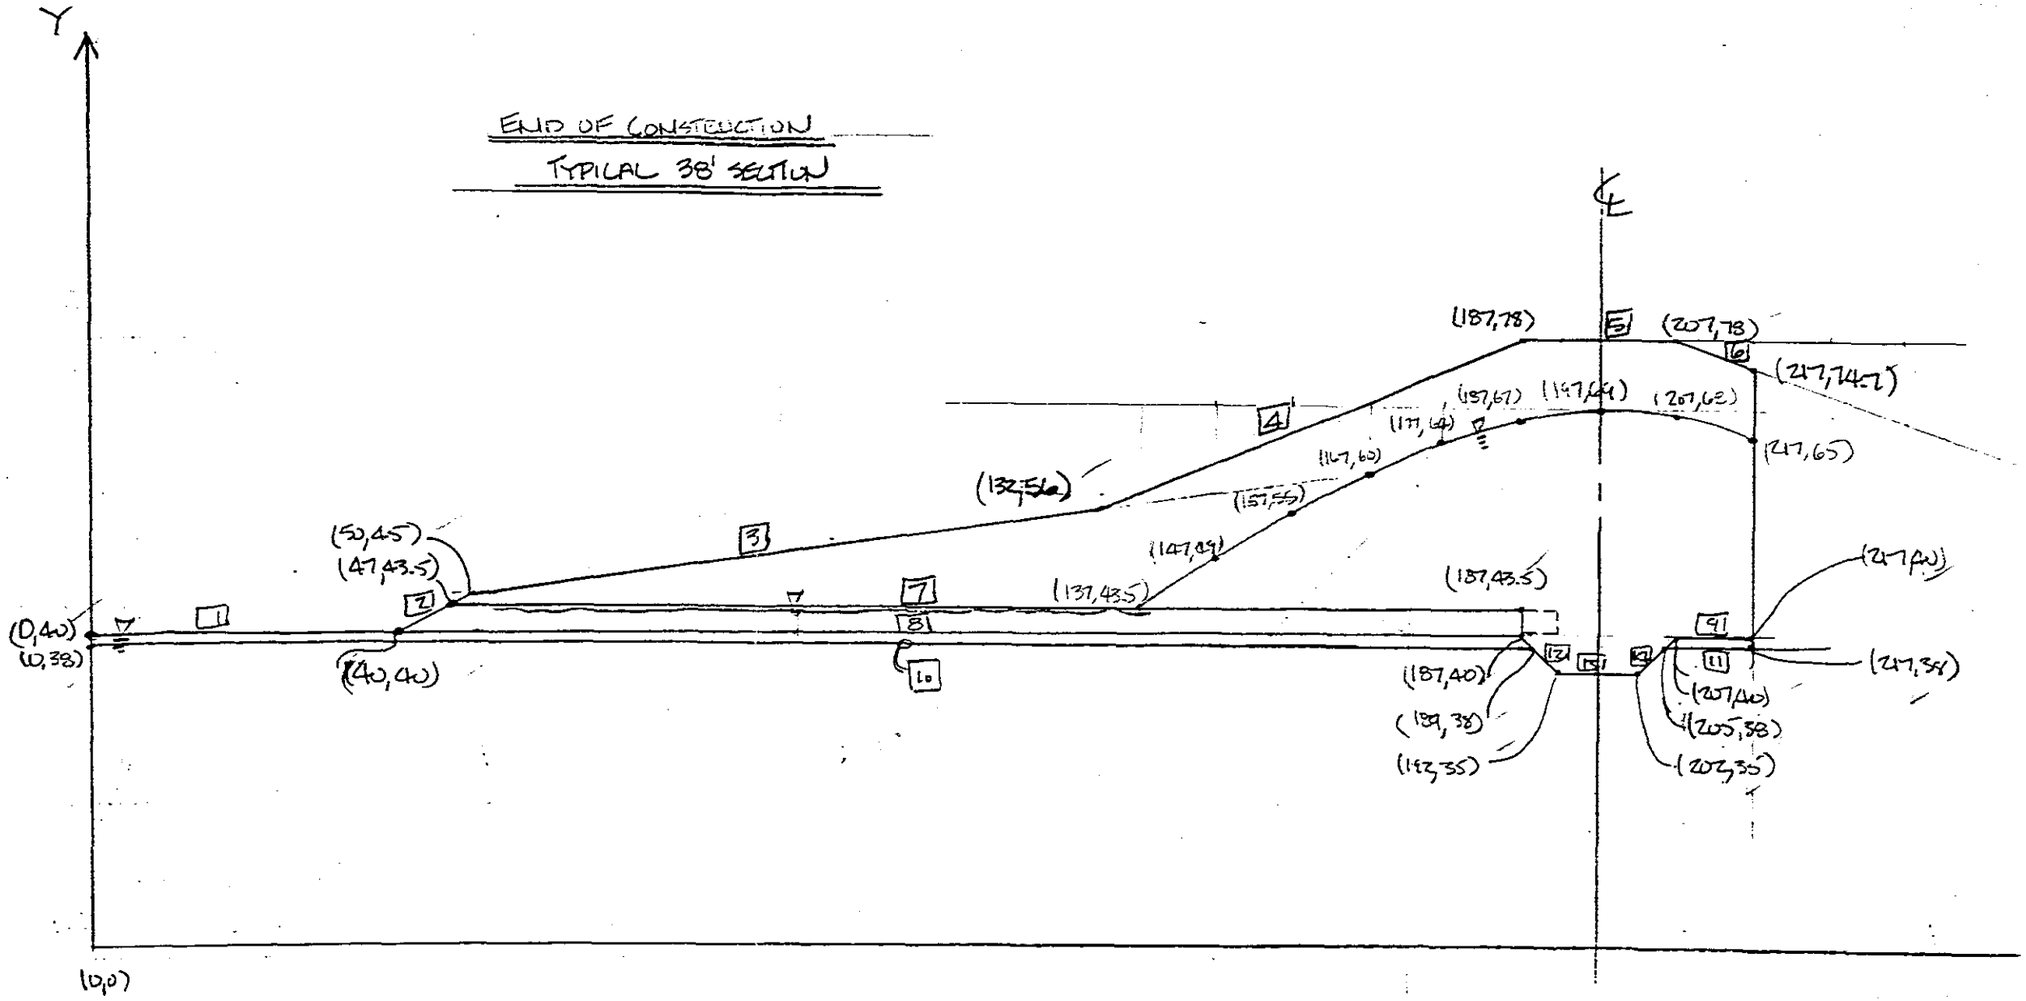
CROSS-SECTION

TO EVALUATE THE SLOPE-STABILITY FOR THE END OF CONSTRUCTION LOAD CASE, THE PHREATIC SURFACE ("LINE OF SEEPAGE") HAD TO BE ESTIMATED (SEE REF#1 FOR EXPLANATION) AS SHOWN ABOVE.

ANALYSIS METHOD

THE SLOPE-STABILITY PROGRAM STABL WAS USED FOR ANALYSIS. BOTH CIRCULAR AND BLOCK FAILURE SURFACES WERE CONSIDERED. WIDE RANGING LIMITS WERE SET FOR BOTH CIRCULAR AND BLOCK FAILURE SURFACE SEARCHES (SEE REF#1 FOR ADDITIONAL ANALYSIS PROCEDURES)

GN-024-4



DO NOT WRITE IN THIS SPACE

SUMMARY OF RESULTS

THE DOWNSTREAM SLOPE PROVED TO BE STABLE FOR THE END OF CONSTRUCTION LOAD CASE. ALL FACTORS OF SAFETY EXCEEDED THE RECOMMEND F.S. = 1.3 (TR-60, SCS "EARTH AND ROCKFILL DAMS"). (SEE SLOPE-STABILITY SUMMARY SHEETS AND OUTPUT FILES)

DWSTRM SLOPE STABILITY, 38' TYP. SECTION, END OF CONSTRUCTION

A CRITICAL FAILURE SURFACE SEARCHING METHOD, USING A RANDOM
TECHNIQUE FOR GENERATING CIRCULAR SURFACES, HAS BEEN SPECIFIED.

100 TRIAL SURFACES HAVE BEEN GENERATED.

10 SURFACES INITIATE FROM EACH OF 10 POINTS EQUALLY SPACED
ALONG THE GROUND SURFACE BETWEEN X = 0.00 FT.
AND X = 140.00 FT.

EACH SURFACE TERMINATES BETWEEN X = 170.00 FT.
AND X = 217.00 FT.

UNLESS FURTHER LIMITATIONS WERE IMPOSED, THE MINIMUM ELEVATION
AT WHICH A SURFACE EXTENDS IS Y = 0.00 FT.

10.00 FT. LINE SEGMENTS DEFINE EACH TRIAL FAILURE SURFACE.

DWSTRM SLOPE STABILITY, 38' TYP. SECTION, END OF CONSTRUCTION

FOLLOWING ARE DISPLAYED THE TEN MOST CRITICAL OF THE TRIAL SURFACES EXAMINED.
THEY ARE ORDERED MOST CRITICAL FIRST.

* * * SAFETY FACTORS ARE CALCULATED BY THE MODIFIED BISHOP METHOD* * *.

A CRITICAL FAILURE SURFACE SEARCHING METHOD, USING A RANDOM
TECHNIQUE FOR GENERATING CIRCULAR SURFACES, HAS BEEN SPECIFIED.

100 TRIAL SURFACES HAVE BEEN GENERATED.

10 SURFACES INITIATE FROM EACH OF 10 POINTS EQUALLY SPACED
ALONG THE GROUND SURFACE BETWEEN X = 0.00 FT.
AND X = 140.00 FT.

EACH SURFACE TERMINATES BETWEEN X = 170.00 FT.
AND X = 217.00 FT.

UNLESS FURTHER LIMITATIONS WERE IMPOSED, THE MINIMUM ELEVATION
AT WHICH A SURFACE EXTENDS IS Y = 0.00 FT.

10.00 FT. LINE SEGMENTS DEFINE EACH TRIAL FAILURE SURFACE.

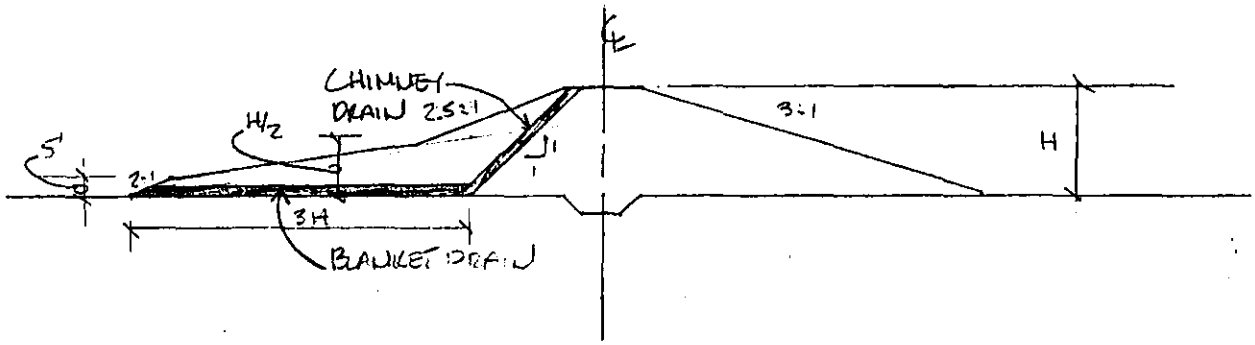
**** END OF FILE, ALL CARDS READ ****



DO NOT WRITE IN THIS SPACE

THE SLOPE-STABILITY ANALYSIS WAS PERFORMED IN TWO PARTS:

(1) PRELIMINARY, (2) FINAL.

PRELIMINARY ANALYSIS

(1) PRELIMINARY SLOPE-STABILITY WAS PERFORMED ON THE FOLLOWING EMBANKMENT CROSS SECTION AND INTERNAL DRAIN SYSTEM

THIS CROSS SECTION WAS BASED ON RECOMMENDATIONS FROM THE U.S. BUREAU OF RECLAMATION, "DESIGN OF SMALL DAMS" FOR EMBANKMENTS ON PERVIOUS FOUNDATIONS. THE DRAINS WERE SIZED USING PMF STEADY-STATE SEEPAGE FLOWS. THE PRELIMINARY ANALYSIS INVOLVED:

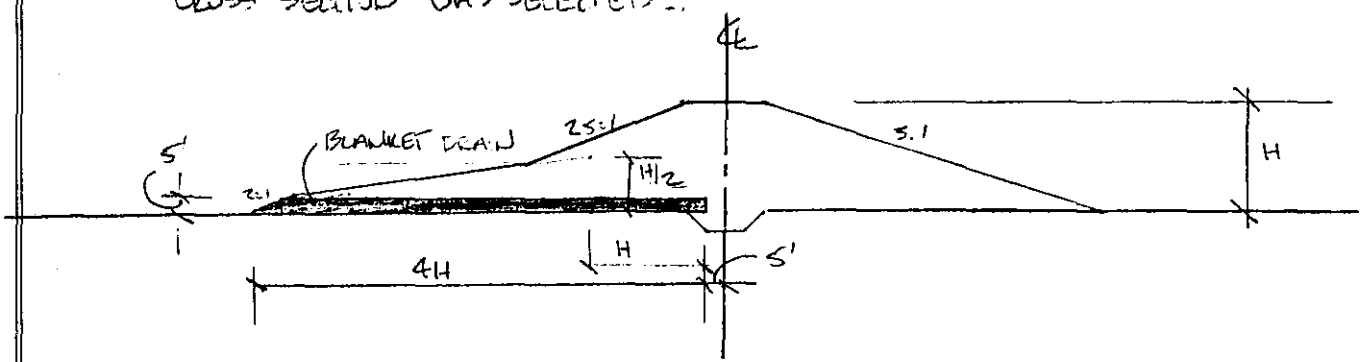
DOWNSTREAM SLOPE

(1) TYPICAL 40' SECTION
   (a) STEADY-STATE SEEPAGE FOR THE PMF EVENT
   (b) EARTHQUAKE LOAD WITH EMPTY BASIN

(2) SECTION AT STA 26+00
   (a) STEADY-STATE SEEPAGE FOR THE PMF EVENT
   (b) EARTHQUAKE LOAD WITH EMPTY BASIN

DO NOT WRITE IN THIS SPACE

(3) TYPICAL 20' HIGH SECTION
- (a) STEADY-STATE SEEPAGE FOR THE PMF EVENT
- (b) EARTHQUAKE LOAD WITH EMPTY BASIN



UPSTREAM SLOPE

(1) TYPICAL 40' SECTION
- (a) RAPID DRAWDOWN – PHREATIC SURFACE DROP FROM FULL PMF ELEV. TO EMPTY BASIN
- (b) RAPID DRAWDOWN – PHREATIC SURFACE DROP FROM FULL PMF ELEV. TO TOP OF SPILLWAY ELEV.
- (c) RAPID DRAWDOWN – PHREATIC SURFACE DROP FROM FULL PMF TO INTERMEDIATE POOL ELEV. 12460'
- (d) EARTHQUAKE LOAD WITH EMPTY BASIN
- (e) END OF CONSTRUCTION

DO NOT WRITE IN THIS SPACE

FINAL ANALYSIS

(2) UPON COMPLETION OF THE PRELIMINARY ANALYSIS, THE SEEPAGE FLOWS WERE REEVALUATED USING A TRANSIENT FLOWNET ANALYSIS VERSES A STEADY-STATE SEEPAGE ANALYSIS. THE INTERNAL DRAIN SYSTEM WAS THEN MODIFIED TO PROVIDE SEEPAGE CONTROL UNDER TRANSIENT CONDITIONS. THE CHIMNEY DRAIN WAS ELIMINATED, AND THE BLANKET DRAIN WAS RESIZED AND RELOCATED. THE BELOW CROSS SECTION WAS SELECTED.

THE FINAL SLOPE-STABILITY ANALYSIS INVOLVED:

DOWNSTREAM SLOPE

SINCE THE SEEPAGE THROUGH THE EMBANKMENT WAS REANALYZED AS TRANSIENT, THE PHREATIC SURFACE LOCATION WITHIN THE EMBANKMENT WAS REVISED FROM THE PRELIMINARY DOWNSTREAM SLOPE STABILITY ANALYSIS. THE PHREATIC SURFACE LOCATIONS WERE DETERMINED THROUGH GRAPHICAL MEANS (FLOWNETS).

DO NOT WRITE IN THIS SPACE

EMBANKMENT'S GEOMETRY WAS REVISED PER THE MODIFICATIONS IN THE INTERNAL DRAINAGE SYSTEM. THE SECTIONS AND

[redacted] FOR THE PMF EVENT
[redacted] AD WITH EMPTY BASIN
[redacted] STRUCTION
[redacted] EEPAGE FOR THE PMF EVENT
[redacted] AD WITH EMPTY BASIN

UPSTREAM SLOPE

ALTHOUGH THE SEEPAGE ANALYSIS METHOD AND INTERNAL DRAINAGE SYSTEM CHANGED FROM THE PRELIMINARY UPSTREAM SLOPE STABILITY ANALYSIS, THESE REVISIONS WERE CONSIDERED MINOR WITH RESPECT TO THE UPSTREAM SLOPE STABILITY, AND FURTHER ANALYSIS WAS DEEMED NOT NECESSARY. THE DESIGN LOAD CASES (RAPID DRAWDOWN, END OF CONSTRUCTION, & EARTHQUAKE) CONSIDERED IN THE PRELIMINARY ANALYSIS ARE CONSERVATIVE WHEN COMPARED TO THE MODIFICATIONS IN THE FINAL EMBANKMENT CROSS SECTION AND SEEPAGE ANALYSIS - FIRST, THE EFFECTS ON THE UPSTREAM SLOPE'S

PHREATIC SURFACE CAUSED BY THE ELIMINATION OF CHIMNEY DRAIN ARE MINOR, AND ADDITIONAL ANALYSIS NOT REQUIRED — SECONDLY, THE PHREATIC SURFACE DEVELOPEMENT UNDER STEADY-STATE SEEPAGE CONDITIONS (PRELIMINARY ANALYSIS) ARE CONSIDERABLY MORE CONSERVATIVE FOR SLOPE STABILITY, THAN TRANSIENT STATE SEEPAGE CONDITIONS.

Purpose

Complete a preliminary retaining wall design for the counterfort walls at each end of the labyrinth spillway in order to define loading conditions for the structural engineer and verify soil parameters provided by the geotechnical engineer.

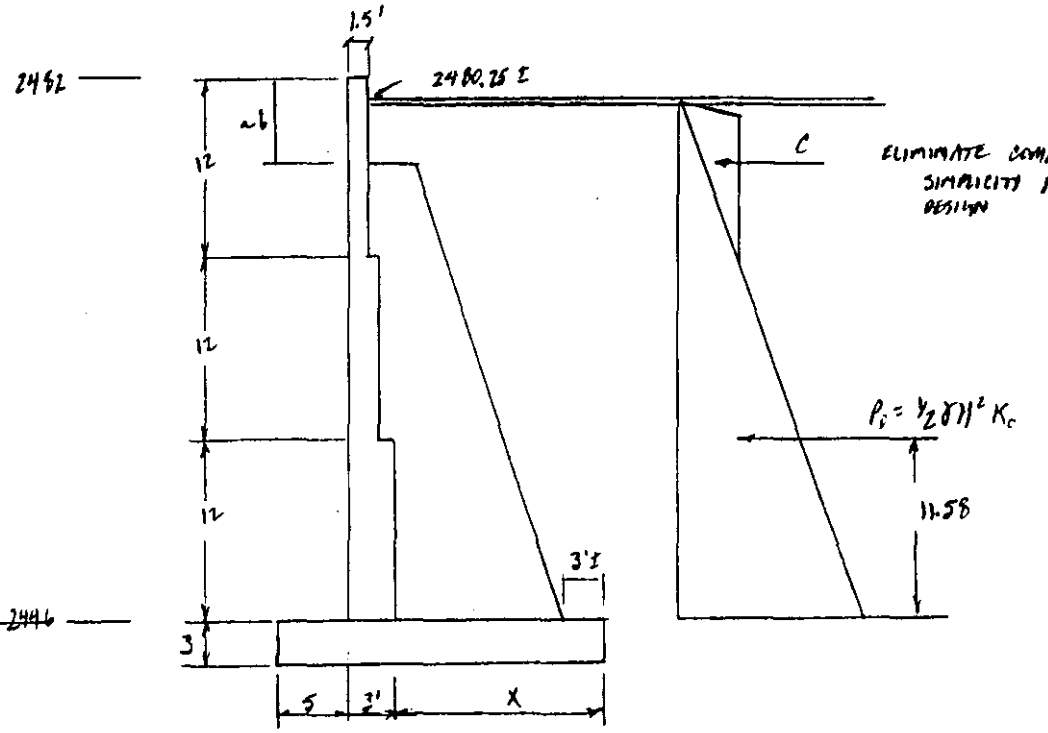
DO NOT WRITE IN THIS SPACE

Procedure

Four loading conditions will be evaluated for the design of the counterfort retaining walls located on each end of the spillway for the Upper Flamengo Work Detention Basin

1. Condition 1. following construction, with damp backfill & compaction loading, not water on the front face of the wall and no established groundwater on the backside of the wall

2. Condition 2 severe condition following construction - following the PMF, partially saturated detention basin embankment - no water on the front face of the wall because it has already passed by. Use a 1.33 factor due to the frequency of the PMF



Condition 1 will be evaluated for the preliminary design. Develop a limit of saturation for the structural engineer so that he can evaluate condition 2 to determine which condition controls the wall design.

REVISED, SUPERSEDED, AND VOID CALCULATIONS MUST BE CLEARLY IDENTIFIED, INITIALED,

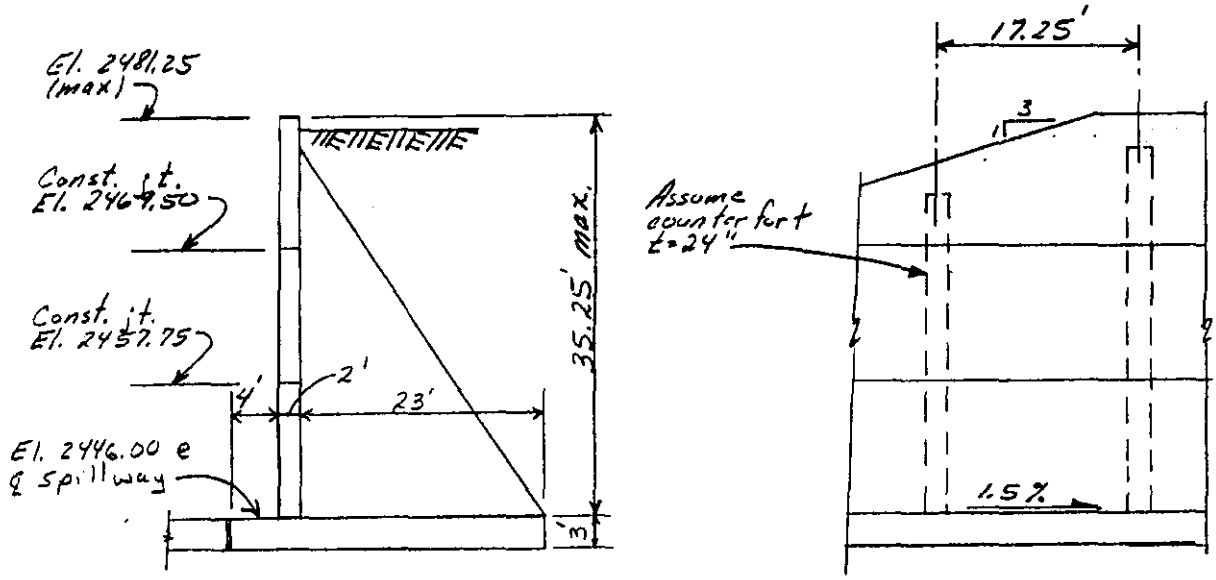
INTRODUCTION:

The retaining walls will be designed using moments and shears found from the reference below.



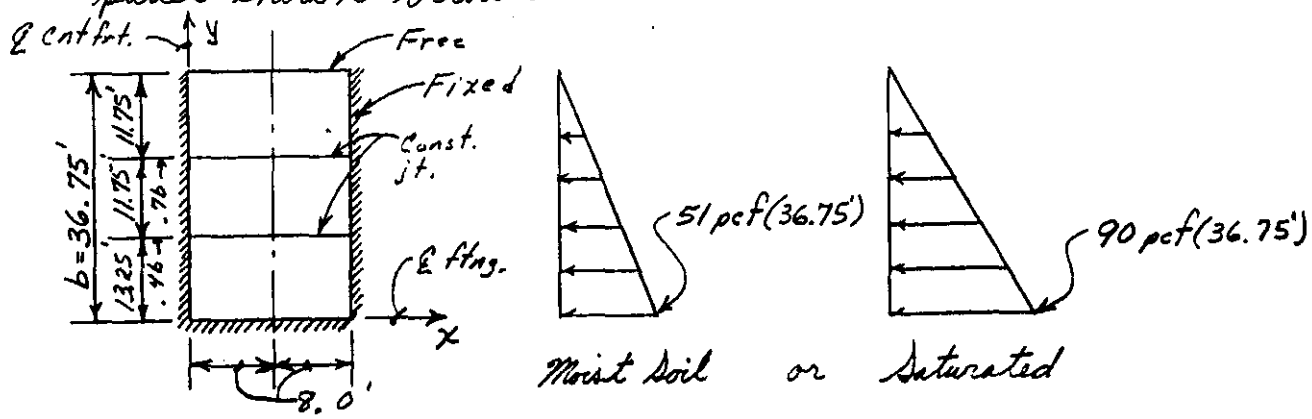
An allowable overstress of 1/3 will be used for stresses from loads which include water in the dam. This is considered appropriate since the facility will not be loaded until a 100 year flood event or greater.

Panels as shown on the following page will be designed for soil pressures previously calculated. Panels A & C will be designed for the same loads.

References:

1.) U.S. Bureau of Reclamation, "Moments and Reactions for Rectangular Plates", 1978.

A. R/C Design for Panel A:



SECTION ELEVATION

DO NOT WRITE IN THIS SPACE

1. R/C Design of Wall:

The wall slab will be designed using the idealized panel shown below:

Moist Soil or Saturated

$a/b = 8.0'/36.75 = 0.22$ to $a/b = 8.0/(2481.25 - 29'/3) - 2446 = 0.30$

Use tables for $a/b = 0.25$

DO NOT WRITE IN THIS SPACE

Panel A - Wall Design Cont'd:

From figure 4 of the U.S. Bureau of Reclamation tables the following moments and reactions are found.

The ACI code allows moments at the face of supports to be used for design, this will be used. Since the support reaction does not introduce compression into the end region of the wall, shear @ d from the of the support is not allowed. ACI Commentary indicates that the shear at the face can be used, however the Tables in the U.S. Bureau of Reclamation do not show shear values other than at the support. Members will be designed for shear at the support.

Check to see if loads from moist soil or saturated soil will control:

$M_{n_{moist}} = \text{coeff.}\ (P)_{moist}(b^2)(1.7)/(0.9)$

$M_{n_{sat.}} = \text{coeff}\ (P_{sat})(b^2)(1.7)/0.9(1\frac{1}{3})$ ← allowable overstress

for $P_{moist} = 51\text{pcf}(b)$ & $P_{sat} = 90\text{pcf}(b)$

$M_{n_{moist}} = \text{coeff}\ (b^3)(51)(1.7)/0.9 = \text{coeff}\ (4,781, 328)$

$M_{n_{sat}} = \text{coeff}\ (b^3)(90)(1.7)/0.9(1\frac{1}{3}) = \text{coeff}\ (6, 328, 229)$

∴ Saturated conditions control.

a. From base to construction jt @ El 2457.75:

Panel A - Wall Design Cont'd:

c. Check shear @ const jt.:

Shear values at locations other than the base of the wall are not tabulated in the U.S. Bureau of Reclamation manual. Shear values will be assumed as 40% of the values found for a cantilever wall. The value of 40% is the ratio of shear at the base using the plate design values versus a cantilevered wall:

$$V_{Base\ for\ cantilever} = 90\ pcf\,(1')(36.75^2)/2 = 60,775^{\#}$$

$$V_{Base\ for\ plate} = 35,554^{\#}(0.85)(1\tfrac{1}{3})/1.7 = 23,703^{\#}$$

$$\therefore \frac{23,703}{60,775} = 0.39 \quad \text{use } 40\%.$$

Shear at El. 2457.75:

$$V = 0.40\,\frac{(90)(36.75^2)}{2}\left(\frac{23.5^2}{36.75^2}\right) = 9,941^{\#}\ w/t = 21"$$

Shear at El. 2469.50:

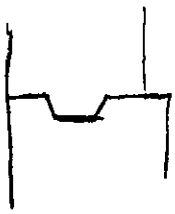
$$V = 0.40\,\frac{(90)(36.75^2)}{2}\left(\frac{11.75^2}{36.75^2}\right) = 2,485^{\#}\ w/t = 14"$$

Check jt. @ El. 2457.75:

$$V_n = 9,941(1.7)/0.85(1\tfrac{1}{3}) = 14,912^{\#}$$

$$\Rightarrow V_c = 2\sqrt{f'_c}\,bd = 2\sqrt{4,000}\,(12")\left(\tfrac{21"}{3}\right) = 10,625^{\#}$$

Since $V_c > V_n$ regd use shear friction:



$$A_{vf} = 14,912^{\#}/60,000(1.0) = 0.25\ in^2$$

Use #4 @ 9" $A_s = 0.26\ in^2$ ←

DO NOT WRITE IN THIS SPACE

Panel A - Wall Design Cont'd:

Check jt @ El. 2469.50

$V_n = 2,485(1.7) / 0.85(1\frac{1}{2}) = 3,728^{lb}$

$\Rightarrow V_c = 2\sqrt{4,000}(12)(\frac{14}{3}) = 7,084^{lb} > 3,728^{lb}$.

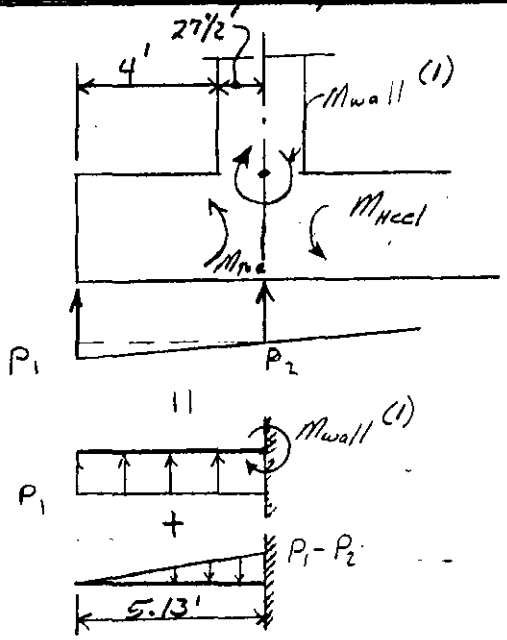
$\therefore$ Use shear key no reinf. ←

Check jt at base of wall:

$V_{n_y} = 35,554^{lb}$

$V_c = 2\sqrt{4,000}(12)(\frac{27}{3}) = 13,661^{lb} < 35,554$

$\therefore$ Add reinf. for shear.



$A_{v_f} = 35,554 / 60,000(1.0) = 0.59 in^2$

Summary:

P-GN-025-A

DO NOT WRITE IN THIS SPACE

Panel D - Wall Design Cont'd:

c. Check shear at the base:

$V_{n_y} = 23,219^{\#}$

$V_c = 2\sqrt{4,000}\,(12)\left(\frac{20"}{3}\right) = 10,119^{\#} < 23,219^{\#}$

∴ Must add reinf. for shear

$A_{v_f} = 23,219 / (1.0)(60,000) = 0.38 in^2/ft.$

Use # 5 @ 9" ($A_s = 0.41 in^2$)

d. Check shear at the const. jt.:

As for Panel A, shear (V_n) will be taken as 40% of the shear in a cantilever wall. For reasoning see page 9 of these calcs.

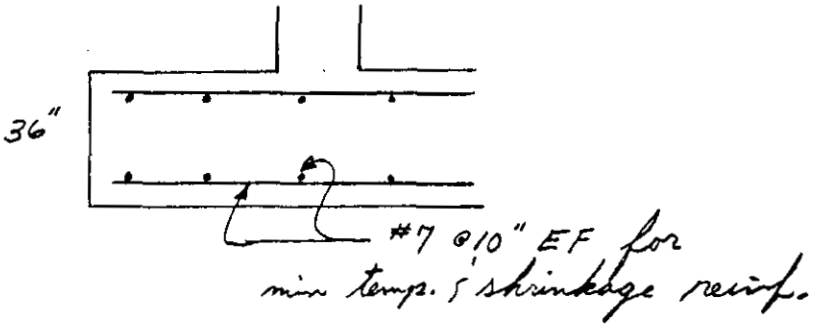
$V_n = .40\,\frac{(90)(25.5^2)}{2}\left(\frac{12.92^2}{25.5^2}\right) = 3,005^{\#}$

$t = 14" + \frac{6"}{24'}(12.92') = 17.2"$

$V_c = 2\sqrt{4,000}\,(12)\left(\frac{17.2}{3}\right) = 8,703^{\#} > 3,005^{\#}$

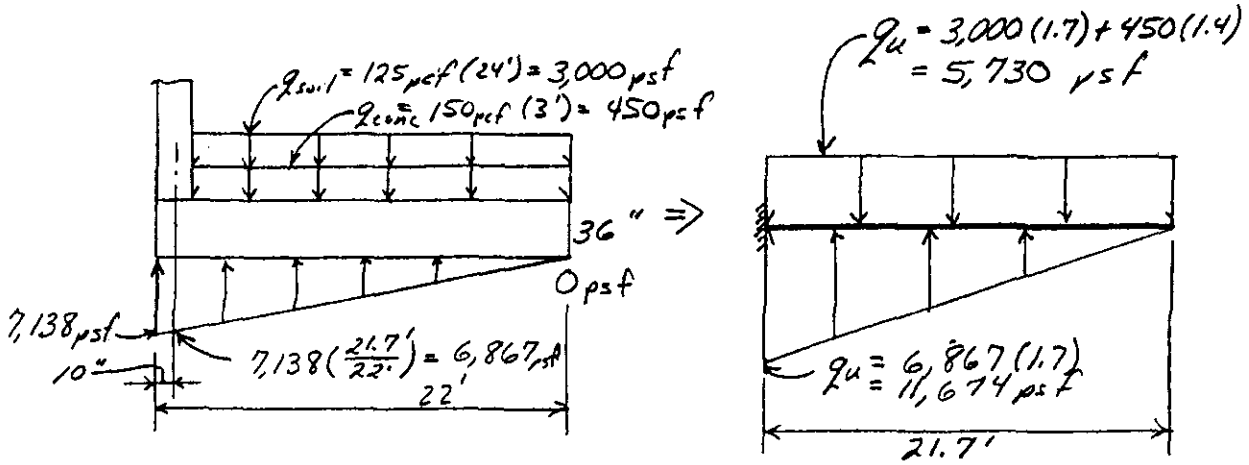
∴ Shear key is okay w/o reinf.

DO NOT WRITE IN THIS SPACE



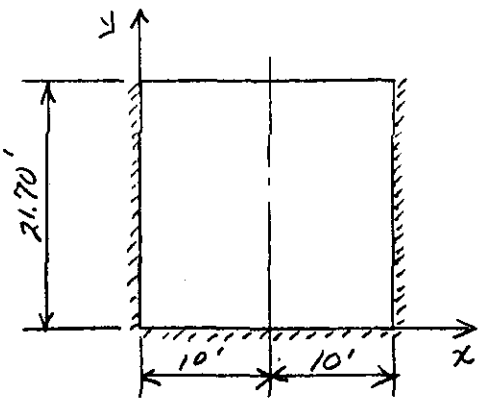
C. R/C Design for Panel D Cont'd:

2. R/C Design of Toe:



Panel D only has a toe for part of its length.

The toe pressure for Panel D is $\frac{3,298}{8,811} \times 100 = 37\%$ of that for Panel A. The toe reinf. reqid for Panel A was 0.68 in² (1⅓), min temp & shrinkage reinf. was 0.65 in².



Reinf. toe in Panel D with min. temp & shrinkage reinf. since Panel A & D have the same base slab Thickness.

C. Panel D - Heel Design:

Design heel slab as for Panel A using a plate fixed on three sides:

$a/b = 10/21.7 = 0.46$ use tables for $a/b = 1/2$.

For M_x at face of counterfort, $x/a = 1'/10' = 0.10$
For M_y at face of the base slab, $y/b = .83/21.7 = .04$

$$M_{nx+} = [(0.0618)(5{,}730) - (0.0120)(11{,}674)](21.7^2)/.9(1')$$

*From: Monfore, G. E. and Lentz, A. E., "Physical Properties of Concrete at Very Low Temperatures," Portland Cement Association Research Bulletin 145, Portland Cement Association, Skokie, 1962.

higher the modulus of elasticity after dehydration. The effects of aggregate type are not clearly defined but appear to be small providing the aggregate does not melt or decompose. If the concrete is subjected to cyclic temperatures, the decrease in modulus is even more severe, probably as a result of thermal stresses.

6.4.5 Effect of Low Temperature Exposure

Data on modulus of elasticity by the resonance frequency method (ASTM C215) on concretes cooled from room temperature to -250°F are listed in Table 6-2. The modulus of sand and gravel concretes in a moist condition increases about 50% as the temperature is decreased to -250°F. The 5.5-bag sand and gravel mix, in equilibrium with an atmosphere of 50% relative humidity, increases only 8% for this same temperature range; and an oven dried specimen exhibits a constant modulus as the temperature decreases.

6.4.6 Repetitive Loading

The stress-strain relationship for concrete subjected to repeated compressive loads is cycle dependent while the relationship for reinforcing steel is cycle independent. During the first cycle the stress-strain curve for concrete is the same as that obtained in static tests, but after a few cycles the curve becomes almost linear. As the number of repetitions of load increases, the lines representing the stress-strain curve become concave upward. There also is a general trend towards a decrease in secant modulus (Fig. 6-24) and an increase in non-elastic strain with an increase in the number of loading cycles, presumably due to the development of microcracks in the concrete. Changes in modulus are also accompanied by a reduction in natural frequency.

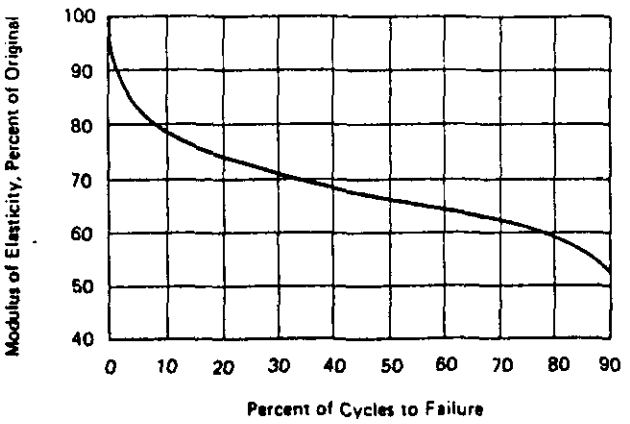

Fig. 6-24 Reduction in secant modulus of elasticity as the result of repeated loads. (From: Linger, D. A., and Gillespie, H. A., "A Study of the Mechanism of Concrete Fatigue and Fracture," *Highway Research News, No. 22*, 40-51. Highway Research Board, Feb. 1966.)

6.5 POISSON'S RATIO

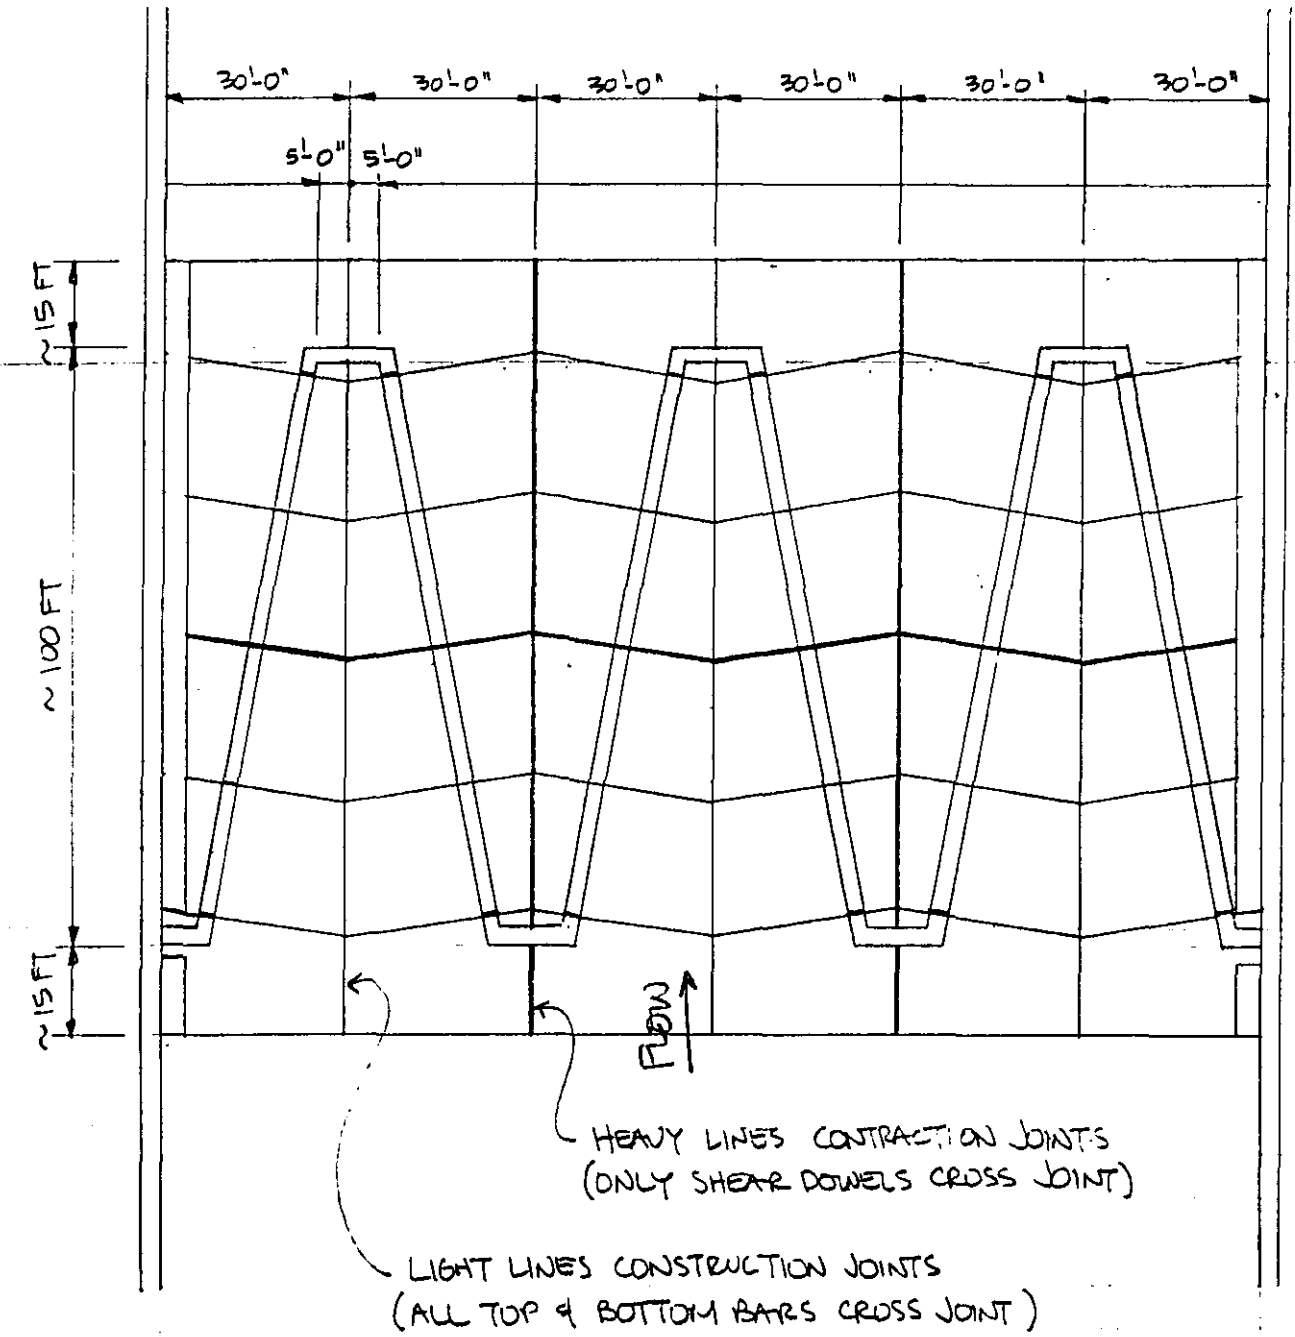
Poisson's ratio is the ratio of transverse (lateral) strain to the corresponding axial (longitudinal) strain resulting from uniformly distributed axial stress. Values of Poisson's ratio, μ, like modulus of elasticity, vary with the Poisson's ratio of the aggregate, the cement paste, and the relative proportions of the two. It also varies with moisture condition and age of the concrete. Values generally range between 0.11 and 0.27. For elastic strains under normal working stresses, Poisson's ratio is taken as 0.20. It is approximately the same for structural lightweight and normal weight concretes. With an increase in strength, age, or aggregate content, Poisson's ratio tends to decrease.

At room temperature, lower values of Poisson's ratio are obtained for higher strength concrete. Results at higher temperatures are erratic and no general trend for the effect of temperature on Poisson's ratio is indicated. Poisson's ratios, calculated from longitudinal and torsional resonant frequency tests remain essentially constant as the temperature of the concrete is lowered from 75 to -250°F.

Dynamic determinations of Poisson's ratio are consistently higher than the corresponding static values, especially at early ages. For saturated concretes, the dynamic values are 0.02 higher for lightweight and 0.03 higher for normal weight concretes, with the difference becoming negligible for dry concretes.

6.6 SHEAR AND TORSION

The resistance of concrete to pure shearing stress has never been directly determined. In addition, the case of pure shear acting on a plane is seldom, if ever, encountered in actual structures. Whenever a state of pure shearing stress is produced in a specimen, it follows from the laws of mechanics that principal tensile stresses, equal in magnitude to the shearing stresses, must also exist on another plane. Since the strength of concrete in tension is less than its strength in shear, failure inevitably occurs as a result of tensile stresses before the strength in shear is reached. Thus, a pure shear test is of no value for determining shearing strength.



A reliable indication of the strength of concrete in pure shear can be obtained only from tests under combined stresses. The most widely used and accepted method of

To/From: BILL SIEGEL
Company: KLEINFELDER
Phone No.: 702-736-2936
Recorded by: CKA

Last Thursday I called Mr Siegel regarding the soil parameters in Kleinfelder GEOTECHNICAL INVESTIGATION - PROPOSED FLAMINGO WASH DETENTION BASIN. I had completed a preliminary design of the counterfort retaining walls for the emergency spillway and determined that a base width greater than 25' was required for the 36' counterfort wall. I asked Bill about the component of friction between soil and concrete, and was informed that Kleinfelder had already reduced the ultimate friction values by a F.S. I informed Mr Siegel that B&V typically uses ultimate friction values, and then applies a F.S for sliding of 1.5 or 2 for retaining walls, depending on whether passive pressure off the toe is considered. Mr Siegel stated that Kleinfelder will send B&V a letter as an addendum to the report stating ultimate friction values, and how the allowable friction values in the report were calculated.

I also asked Mr Siegel about the allowable bearing capacity of 2000 psf listed in the report.

I completed a calculation using the procedures outlined in Winterkorn + Fang, Chapter 3, for an eccentrically loaded footing, and obtained an ultimate bearing capacity of 33,500 psf for the 25' wide footing. Depending on the selection of FS, q_{all} = 11164 psf or 16750 psf. With these high values, the allowable bearing pressure may be controlled by maximum tolerable settlement. From Peck, Hanson, + Thornburn, Chapter 19, I obtained a value of 4 TSF (Using ϕ_{avg} = 36°, N = 37 blows/ft ⇒ q_{all} = 4 TSF) Mr Siegel indicated that Kleinfelder rarely recommended q_{all} > 6000 psf, but he would talk to Larry Peterson.

Bill called today, and indicated that Kleinfelder would recommend q_{all} = 8000 psf for the counterfort retaining wall design. He stated that this value would yield a total settlement of 3/4" to 1" and a differential settlement of approximately 1/2". I indicated that this appeared satisfactory for a retaining wall.

To (From): Steve Roberts
Company: B&V - Las Vegas
Phone No.: 702-732-0448
Recorded by: Wayne Saeed

Steve has discussed soil values stated in Geotech report with Bill Siegel & Kleinfelder.

Max allowable soil bearing value for counterfort walls can be taken as 8,000 psf w/ total settlement of 3/4" to 1" and approximate differential settlement of 1/2". Steve wants max. soil bearing of 7,000 psf used.

Coefficient of friction stated in geotech report has a factor of safety already applied to it. Steve wants to design retaining walls with a coefficient of friction between 0.55 and 0.60 (0.58 selected) with a factor of safety of 1.5.

Steve requested that allowable soil bearing & coefficient of friction values be increased by 1/3 for saturated soil conditions. Steves reasoning is that the frequency of the flood which causes saturation is greater than once in 100 years.

Soil values to be used for the retaining walls have been taken from the geotech. report as follows:

1. Using stated value for G_{max} and $\gamma_{d\,max}$:

$\gamma_{d\,max} = 134$ pcf

$G_{max} = 2.61$

$\therefore e = \left(G \frac{\gamma_w}{\gamma_d} - 1\right) = \left(2.61 \frac{62.4}{134}\right) - 1 = 0.21 \quad (21.5\%)$

Embankment is to be compacted to 92% of maximum dry density.

$\gamma_{d\,in\,place} = 0.92\,(134) = 123.3$ pcf

Assuming that the in place material will have a moisture content of 6% (from proctors)

$\gamma_{t\,in\,place} = \gamma_d\,(1+w) = 123.3\,(1+0.06) = 130.7$ pcf

$\gamma_b = 130.7$ pcf $- 62.4$ pcf $= 68.3$ pcf

For lateral pressure, using $\phi = 36°$ from shear test results:

$p_{a\,6\%,\,92\%} = 130.7\,(1 - \sin\phi) = 53.9$ pcf

$p_{a\,sub.} = 68.3\,(1 - \sin\phi) + \text{water} = 28.2 + \text{water}$

} Counterfort (at rest)

$p_{a\,6\%,\,92\%} = 130.7\left(\frac{1-\sin\phi}{1+\sin\phi}\right) = 33.9$ pcf

$p_{a\,sub} = 68.3\left(\frac{1-\sin\phi}{1+\sin\phi}\right) + \text{water} = 17.7 + \text{water}$

} Cantilever (active)

2. Using stated values in soils report:

$p_a = 32$ pcf active.

$p_a = 48$ pcf at rest.

IN THIS SPACE
DO NOT WRITE

3. Using results of proctor curves:

$\gamma_{t_{max}}$ = 135.5 pcf @ 6% moisture content

$\gamma_{t_{in\ place}}$ = 0.92 (135.5) = 124.7 pcf

γ_b = 124.7 − 62.4 = 62.3 pcf

$p_{a_{6\%,\ 92\%}}$ = 124.7 $(1 - \sin \overleftarrow{36^\circ})$ = 51.4 pcf
p_{a_b} = 62.3 $(1 - \sin\phi)$ + water = 25.7 + water
} at rest

$p_{a_{6\%,\ 92\%}}$ = 124.7 $\left(\frac{1-\sin\phi}{1+\sin\phi}\right)$ = 32.4 pcf
p_{a_b} = 62.3 $\left(\frac{1-\sin\phi}{1-\sin\phi}\right)$ + water = 16.2 + water
} active

Values selected for design of walls: ←

Counterfort (at rest):

p_a = 51 pcf with γ_t = 125

p_{a_b} = 27.0 pcf + water = 89.4 pcf use 90 pcf w/ $\gamma_b + \gamma_w$ = 125 pcf

Cantilever (active):

p_a = 32.5 pcf with γ_t = 125

p_{a_b} = 17.0 + water = 79.4 pcf use 80 pcf w/ $\gamma_b + \gamma_w$ = 125 pcf

Retaining walls will be placed at NE and SW sides of the spillway to retain the earthen dam. An elevation of the retaining wall is shown in Figure 1.

Based on past experience, counterfort retaining walls have been selected for wall heights greater than 15 feet. Counterforts will also serve as cutoff walls for seepage.

Horizontal and vertical joints are shown on Figure 1.

Counterfort retaining walls will be designed according to the procedures outlined in the following references 2, 3 with the exception that moments and shears for R/C design will be determined from the U.S. Bureau of Reclamation tables.

In addition to their effectiveness in drainage, inclined and horizontal drains eliminate the problem of frost heave as they prevent movement of water into the backfill by capillary action.

12.7 LOADS ON RETAINING WALLS

After the loads on the retaining structure have been determined, one may proceed to the structural design. While there are almost unlimited structural arrangements that may serve as retaining walls, we consider only the types most commonly used. These are usually of reinforced or plain concrete. The mechanics of reinforced concrete design are adequately presented in many books. In this chapter we devote attention primarily to the computation of the loads on the various components of the structure.

1. Gravity Walls

Gravity walls are commonly constructed of plain concrete although light reinforcements are sometimes used. The proportions of gravity walls are usually made so that the B to H ratio (Fig. 12.2a) is between $\frac{1}{2}$ and $\frac{2}{3}$. It is required that there be no tensile stress in the concrete.

Since gravity walls usually have a sloping back, the resultant earth pressure (P_a in Fig. 12.15) may be computed by Coulomb's theory. The most critical section as far as stresses are concerned is the section $a'b'$. To ensure that no tensile stress exists at b' it is desirable that the resultant force on this section be within the middle third of the section as illustrated in Fig. 12.15. The forces are the earth pressure P_a and the weight of the wall W. The location of the resultant R may be determined by summation of moments about b', or

$$x_R = \frac{P_x y' + Wx}{W + P_y} \tag{12.24}$$

2. Cantilever Walls

Cantilever walls are constructed so that the wall acts as a cantilever beam (Fig. 12.2b). The ratio B to H is usually between $\frac{1}{2}$ to $\frac{2}{3}$ and the toe B' is about $\frac{1}{3}$ of B. Cantilever walls should be designed so that the wall and the footing can withstand the bending stresses. The loads to be considered are described in the succeeding paragraphs.

Wall The bending moment in the wall is caused by the earth pressure on the back. If we consider the section ab at the base of the wall, the forces that act on the wall include the earth pressure, the weight of the wall and the weight of the soil in bde (Fig. 12.25a). The earth pressure P_a on the back of the wall may be taken to be the same as the earth pressure on the vertical plane $c'f$. The line bc' is parallel to the ground surface. Rankine's theory (Eq. 12.5) may be used for this case.

The bending moment at section ab may be computed by summation of the moments due to P_a, W_1, and W_2. The shear on this section is equal to the horizontal component of P_a.

Toe Projection The forces that act on section aa' are shown in Fig. 12.25b. They are the soil pressure p on the footing, the weight of the toe projection W_3, and the weight of the soil above the footing W_4. These three contribute to the bending moment on section aa'. Of somewhat lesser importance is the passive earth pressure p_p on the side of the footing and the shear stress between the footing and the soil. These two contribute to the normal stress on section aa' but under most conditions their effect is relatively small. The shear across section aa' is the difference between the soil pressure p and the weights W_3 and W_4.

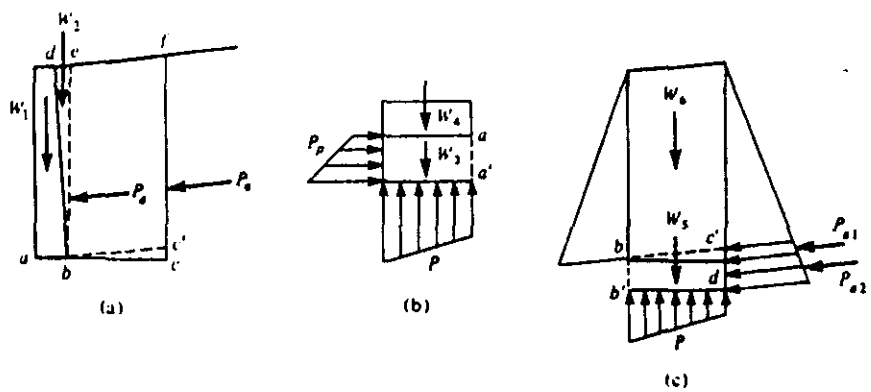

Fig. 12.25 Loads on cantilever walls.

Heel Projection Figure 12.25c shows the forces that act on the heel slab. We consider first the soil mass $c'bef$. It is assumed that the earth pressures on $c'f$ and be are equal. Hence only the active earth pressure $P_{a1} + P_{a2}$ on $c'd$ is left to be considered. The vertical component of this pressure produces a bending moment on section bb'. In addition there are the bending moments produced by the weight of the footing W_5, the weight of the soil above the footing W_6, and the soil pressure p on the base of the footing. These same forces also produce shear on section bb'. The *normal stress* on section bb' includes the horizontal component of the earth pressure $P_{a1} + P_{a2}$ and the shear stress between the soil and footing.

3. Counterfort Walls

The following proportions are commonly used for counterfort walls. The ratio of B to H is between $1/2$ to $2/3$. The spacing L between counterforts ranges from $1/3$ to $1/2$ of H. The earth pressures that act on the counterfort wall may be taken to be the same as that on the cantilever wall.

Wall Slab The wall slab in the counterfort wall is supported by the vertical counterforts and by the footing at the bottom. Thus it acts as a two-way slab and is commonly reinforced in both vertical and horizontal directions. The design of the slab is separated into the design of horizontal beams that span between the counterforts and vertical cantilever beams fixed to the footing.

Figure 12.26a shows the horizontal component of the earth pressure on the wall. The moments in a slab supported along three edges and subjected to such a distributed load has been analyzed (Portland Cement Assn., 1951). Figure 12.26c shows the variation of the moments in the horizontal and vertical directions along a line midway between two counterforts (aa' in Fig. 12.27a). The horizontal beams are continuous over the counterforts and are designed as if there is no shear between adjacent beams. The vertical beams should be designed to resist the pressure abf (Fig. 12.26b).

The negative bending moment at the bottom is taken to be

$$M_b = -0.03pHL \qquad (12.25)$$

where p is the pressure af in Fig. 12.26b. The maximum positive bending moment near the lower ¼-point of the wall is taken to be $M_b/4$. The positive moment may be taken to to be zero at the upper ¼-point.

Toe Slab The design of the toe slab is the same as that for cantilever walls (section 12.6.2).

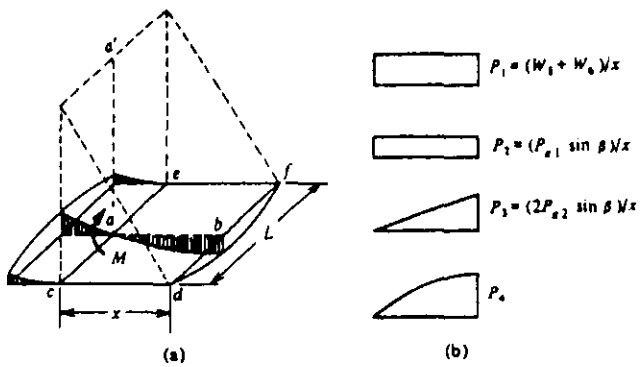

Fig. 12.27 Loads on heel slab of counterfort walls.

Heel Slab The heel slab ($cdfe$ in Fig. 12.27a) is supported by the bottom of the counterforts and the bottom of the wall slab. However, in current practice, the slab is designed as a one-way slab supported by the counterforts. The loads that act on the heel slab include the weight of the soil in $bcfe$ (Fig. 12.25c), W_6, the weight W_5 of the slab, the vertical components P_{a1} and P_{a2} of the earth pressure, and the soil pressure p on the bottom of the slab. These loads are shown in Fig. 12.27b.

In addition Huntington (1957) has pointed out that it is necessary to consider the slab deformation caused by the bending of the toe projection (Fig. 12.27a). The deflection at b midway between counterforts is related to the bending moment M in the toe. Huntington (1957) has recommended that this effect be considered as an additional vertical load on the slab. The distribution of this load is assumed to be parabolic across the width of the slab ab (Fig. 12.27a) with a maximum p_4 at b. The value of p_4 is given by

$$p_4 = 2.4\frac{M}{x}\chi^2 \qquad (12.26)$$

The net load on the heel slab is illustrated in Fig. 12.28c. The net vertical load at b is

$$q = p_1 + p_2 + p_3 + p_4 - p_b \qquad (12.27)$$

The slab is designed as beams running between the counterforts. The beams are assumed to carry a uniformly distributed load which is equal to q for the beam dbf (Fig. 12.27a). The load decreases linearly to zero for the beam cae.

Counterforts The counterforts are designed to resist the earth pressure P_a (Fig. 12.25a) that acts on the wall. The

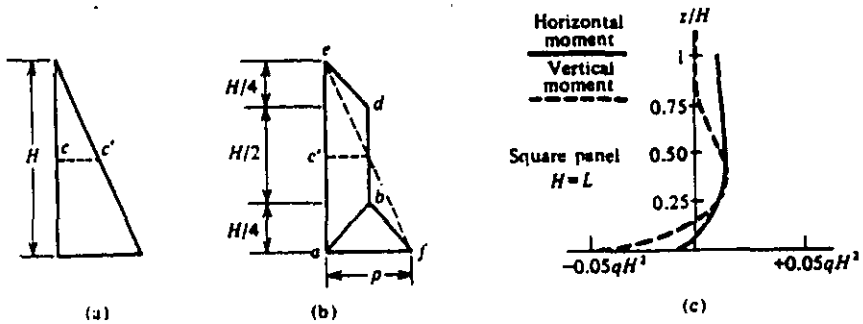

Fig. 12.28 Loads on counterfort walls.

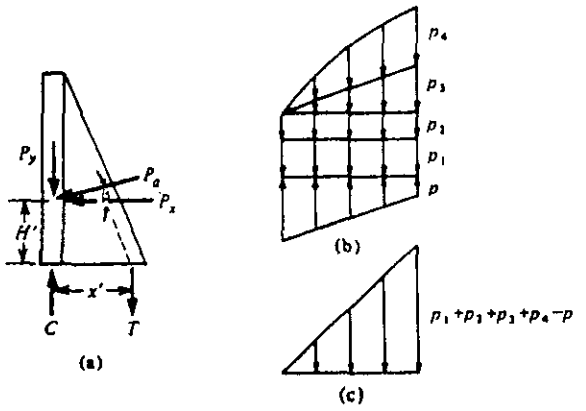

Fig. 12.28 Loads on counterfort walls.

bending moments produced by the earth pressure and the resisting moments are shown in Fig. 12.28. The compression C is assumed to be a concentrated force acting at the center of the wall and T is the tensile force in the reinforcing steel. Thus, we have

$$C = -T = \frac{H'P_a \cos \beta}{x'} \qquad (12.28)$$

Numerical example: The procedures outlined in the preceding sections are illustrated by the subsequent calculations for a wall 25 ft high. The trial dimensions are shown in Fig. 12.29a. The counterfort spacing is taken as 10 ft. The backfill consists of dry cohesionless sand with a unit weight of 120 pcf and an angle of internal friction of 30°.

The earth pressure on $c'f$ is computed with Eq. 12.5. At c'

$$p_a = 120 \times 23 \cos 10° \frac{\cos 10° - (\cos^2 10° - \cos^2 30°)^{1/2}}{\cos 10° + (\cos^2 10° - \cos^2 30°)^{1/2}}$$

$$= 120 \times 23 \times (.354) = 965 \text{ psf}$$

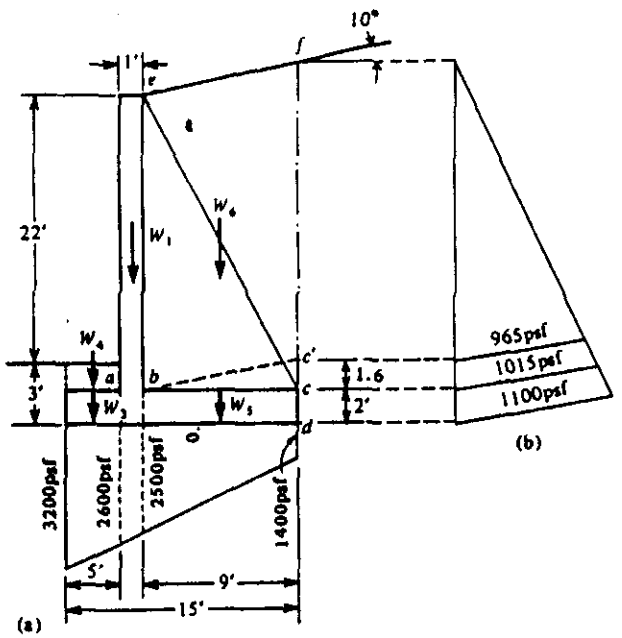

Fig. 12.29 Design of counterfort wall.

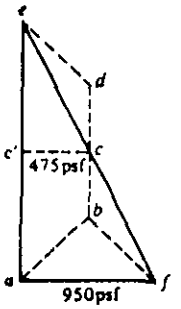

Fig. 12.30 Earth pressure on counterfort wall.

Similarly, the pressures at c and d are 1030 and 1120 psf. The earth pressure distribution is shown in Fig. 12.29b.

The soil pressures on the foundation may be calculated by summation of moments about the centerline of the foundation. The weights and resultant earth pressure are

$$W_1 = 150 \times 1 \times 25 = 3750 \text{ lb}$$
$$W_3 = 150 \times 2 \times 5 = 1500 \text{ lb}$$
$$W_4 = 120 \times 1 \times 5 = 600 \text{ lb}$$
$$W_5 = 150 \times 2 \times 9 = 2700 \text{ lb}$$
$$W_6 = 120 \times 23.5 \times 9 = 25{,}700 \text{ lb}$$
$$P_{ax} = \tfrac{1}{2} \times 1100 \times 25 \cos 10° = 13\,500 \text{ lb}$$
$$P_{ay} = \tfrac{1}{2} \times 1100 \times 25 \sin 10° = 2380 \text{ lb}$$
$$\Sigma M_o = 3750 \times 2.0 + (1500 + 600)\,5.0 - (25\,700 + 2700)\,3.0 + 13\,500 \times \tfrac{26.6}{3} - 2380 \times 7.5 = 34{,}600$$

From Eq. 12.16 we compute the pressures

$$p = \frac{34{,}430}{15} \pm \frac{6 \times 34{,}600}{15^2} = 3{,}200 \text{ and } 1{,}400 \text{ psf}$$

at the toe and heel, respectively. The distribution of soil pressure is shown in Fig. 12.29a.

To compute the horizontal bending moment in the wall, we use the earth pressure distribution shown in Fig. 12.30. The pressure af is equal to the horizontal component of the pressure at c' (Fig. 12.29) or 950 psf. Hence the horizontal reinforcement should be designed for a uniformly distributed load of 475 psf (cc' in Fig. 12.30). The vertical moments in the wall are computed by Eq. 12.25 and are equal to

$M = -0.03 \times 950 \times 23 \times 10 = -6550$ ft-lb at the bottom and

$M = \frac{1}{4} \times 6550 = 1640$ ft-lb at 5.7 ft from the bottom.

These values apply to the design of vertical reinforcements in the wall midway between counterforts and represent the maximum required in the wall. At locations close to the counterforts, the moments would be much smaller and the reinforcement may be reduced. Details of this have been given by Huntington (1957, p. 501).

The moment in the toe slab is (see Fig. 12.25b)

$$M_a = -(1500 + 600)\,2.5 + 2790 \times 5 \times 2.5 + \tfrac{1}{2} \times 960 \times 5 \times \tfrac{2}{3} \times 5 = 37\,300$$

The loads on the heel slab are:

$$p_1 = (2 \times 9 \times 150 + 23.8 \times 9 \times 120)\,(1/9) = 3120 \text{ psf}$$
$$p_2 = \tfrac{1}{2}(965 + 1030) \times 0.9 \sin 10° \times (1/9) = 30 \text{ psf}$$

$$p_3 = 2\left(\frac{(1030 + 1120)}{2}\right) 2.0 \times \sin 10^\circ (1/9) = 80 \text{ psf}$$

$$p_4 = 2.4 \times \frac{37{,}300}{9} = 10{,}000 \text{ psf}$$

$$q = 3120 + 30 + 80 + 10{,}000 - 1120 = 12{,}110 \text{ psf}$$

$$M_b = \tfrac{1}{12} \times 12{,}110 \times 10^2 = 100{,}000$$

4. Foundation Walls and Restrained Abutments

Foundation walls of reinforced concrete are commonly used around basements. These walls are supported at the top and bottom as shown in Fig. 12.3a. The wall then acts as a simply supported beam with a span H. The footing serves only to support the weight of the wall and the vertical loads on H. Such walls are not free to move. Hence the earth pressure would be close to the at-rest pressure

$$p_o = K_o \gamma y$$

as shown in Fig. 12.3b. Typical values of K_o are given in Table 12.3. However, the choice of the design earth pressure requires consideration of the construction sequence. If the wall supports a natural deposit, an excavation is usually made after which the retaining wall is constructed. The space left between the wall and the soil is then backfilled. The excavation allows the soil to expand laterally and consequently the horizontal stress in the natural soil deposit is reduced. Observations in tunnel construction (Peck, 1969) indicate that K would be close to 1.0 under these conditions. However, if the backfill is well compacted, the at-rest earth pressures in the backfill may be very large (Table 12.3) and this pressure would govern the design.

The case of a bridge abutment that is restrained at the top is similar. However, bridge abutments are usually not restrained by the floor slab at the footing level, and some displacements may occur at the bottom. Such displacements are rarely large enough to change significantly the earth pressure distribution. Thus the design earth pressure may be taken as equal to those given in the preceding paragraph.

5. Crib Walls

Crib walls (Fig. 12.31a) may be built of timber, precast concrete, or steel members. Many types of precast concrete and prefabricated steel are available from manufacturers. The inside of the cribs are filled with soil and the whole unit acts as a gravity wall.

In the design of crib walls stringers are considered to act as simply supported beams that span the space between the ties. The stringers that constitute the face are subjected to the pressure of the soil inside the crib, while those that make up the back must resist the difference between the earth pressure exerted by the backfill and that of the soil inside. The earth pressure exerted by the backfill on the wall may be computed in the same manner as for gravity walls. The soil inside the crib is usually placed in well-compacted layers and the inside pressure would be close to the at-rest earth pressure given in Table 12.3.

The computation of the safety with respect to overturning and sliding are the same as for concrete gravity walls. However, not all the weight of the soil in the crib can be counted on to resist the overturning moment. If the wall tilts forward the soil inside may not move as an integral part of the wall. Rather, it may move downward with respect to the wall, and shear stresses would develop between the soil and the wall. These shear stresses act vertically downward and contribute to the resistance against overturning. The stresses may be computed by means of the arching theory (Terzaghi, 1943). If the angle of friction between the soil and wall is δ, the average horizontal stress on the wall at depth y is

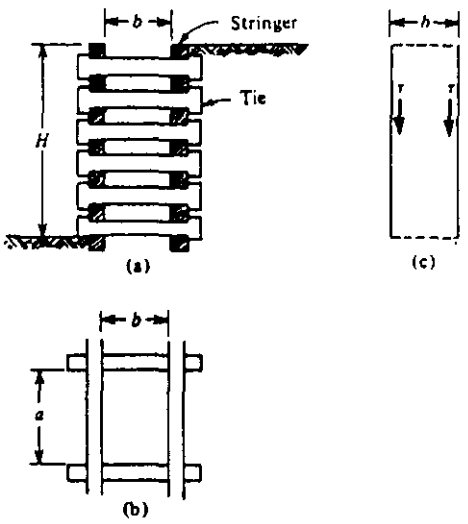

Fig. 12.31 Crib walls.

$$\sigma = \frac{ab}{2(a+b)} \frac{\gamma K_o}{\tan \delta} \left\{1 - \exp\left[-\frac{2yK_o(a+b)}{ab} \tan \delta\right]\right\} \quad (12.29)$$

The shear stress between soil and wall is (Fig. 12.31b)

$$\tau = \sigma_x \tan \delta$$

and the total vertical force transmitted by friction is

$$F = ab\gamma \left\{H - \frac{ab}{2(a+b)\tan \delta K_o} \left[1 - \exp\left(-\frac{2(a+b)}{ab} H \tan \delta K_o\right)\right]\right\} \quad (12.30)$$

The force F plus the weight of the crib constitutes the weight W to be used in Eq. 12.17. The stringers should be designed to resist σ_x. Since stringers are usually of the same size in a given crib wall, the value of y in Eq. 12.29 should be set equal to H.

6. Tieback Wall

Retaining walls are sometimes supported by tiebacks anchored in firm material as shown in Fig. 12.4a. Basement walls may be designed to support the sides of excavations during construction. Construction usually begins with installation of the columns, or soldier beams. These are supported by the anchor ties. The wall between the columns may consist of reinforced concrete, precast concrete panels, fabricated metal pieces, or wooden lagging. The ties are stressed to support the columns.

The wall deflection is naturally dependent on the tension in the tie and may range from almost zero to 3 inches at the top for walls 50 ft in height (Shannon and Strazer, 1970). If the bottom of the column is not driven into stiff soils, considerable movement may take place at the bottom. Model tests of tieback walls in sand (Hanna and Matallana,

Bowles, J. E., "Foundation Analysis and Design", M'Graw-Hill Book Company, New York, 1982.

easier to construct the shear and moment diagram by use of the differential equations for shear and moment as shown in the figure.

The use of the differential equation enables rapid computation of the cutoff points for the reinforcing steel, since it is uneconomical to use a constant amount of reinforcing for the entire wall height.

From Fig. 12-11*b* the weight of the base slab is deducted from the gross-soil-pressure diagram before computing the shear and moment diagrams. The eccentricity is computed by Eqs. (*c*) and (*d*). It is also convenient to use the differential equations for computing the shears and moments of the base slab if the shape of the curve is desired or if numerical values are to be evaluated at points other than the ends.

Counterfort Walls

Counterfort walls are indeterminate problems which can be solved using plate theory, at the expense of considerable labor. Simplified methods are commonly used to solve the problem, which generally will result in a wall somewhat overdesigned. The weight of the counterfort is usually neglected in the computations.

Figure 12-12 indicates a simplified and conservative solution to a counterfort-wall problem. The face slab of the wall is taken as a continuous slab

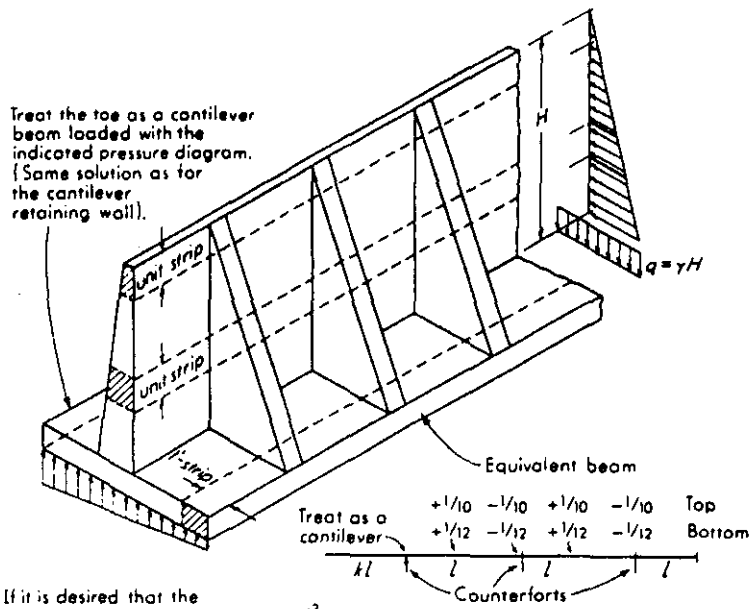
made up of a series of equivalent-unit-width beams. Since the pressure distribution is triangular, the equivalent beams should be analyzed for strips at the junction of the wall and base, and at two or three intermediate locations between the top of the wall and the base, so that adjustments in reinforcing-steel requirements can be made as the pressure decreases. Moment distribution may be employed for finding the bending moments; however, because of approximations being made, continuous-beam coefficients may be used. Values of $wl^2/12$ or $wl^2/14$ may be used for the lower strips, because of the lower edge being fastened to the base, and $wl^2/9$ or $wl^2/10$ for the upper strips. For a conservative solution the same coefficients for both positive and negative moments may be used, although smaller values for the positive moments may be used, as the designer considers appropriate. The toe of the base is treated as a cantilever beam and the heel as a continuous beam, similar to the treatment of the face slab. The ACI Code requirements for shrinkage steel should be satisfied in the directions not analyzed in this manner. The counterfort member can be treated as a wedge-shaped T beam, which includes the applicable portion of the wall stem as the flange, but these beams are so massive that the concrete stresses will be so low that an analysis is usually not required. Tensile steel will be required at the junction of the base (heel) and the counterfort to resist the moment, tending to tip the wall over, and the quantity can be conservatively computed, treating the



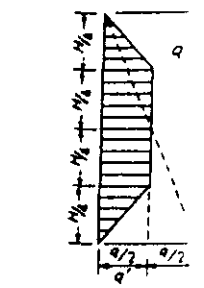


Figure 12-12 Reduction of the complex analysis of a counterfort retaining wall to a system of simple beams for rapid design.

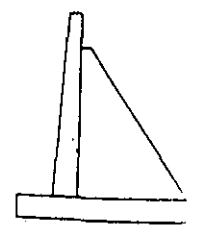

counterfort alone as a beam. Tensile steel will also be required running horizontally from the counterfort into the stem to tie the wall and counterfort together. The slope of the counterfort member may be controlled by the bond-stress requirements of this reinforcement.

Huntington (1957) presented a solution for the counterfort-wall problem, as shown in Figs. 12-13 to 12-15. Huntington also recommended a value for Q_{xx} in the middle half of the wall, at the base of $0.2qH$, to be used as long as the ratio of counterfort spacing to the wall height l/H is not greater than 0.5.

Figure 12-14 Distribution of vertical moments in a counterfort wall stem for Huntington's procedure. (a) Distribution of shear and moment vertically in stem; values should only be used if $H/l \leq 2$; (b) distribution of moment horizontally in stem. Assume that both positive and negative moments vary linearly as shown.

(b)

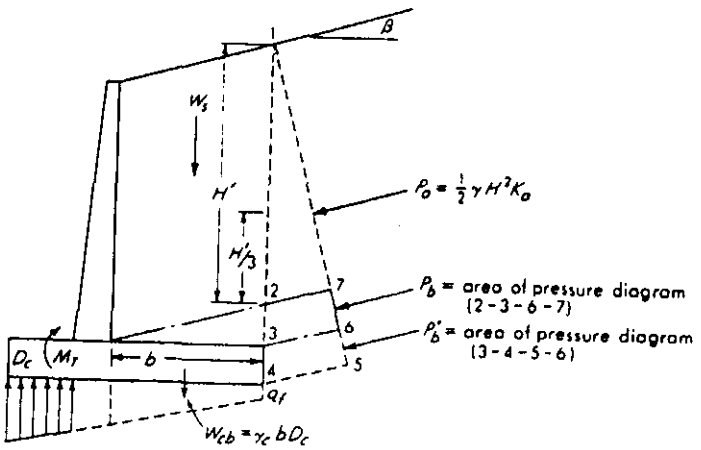

Figure 12-13 Computation of bending moments in the horizontal direction for the counterfort stem. [*After Huntington (1957).*]

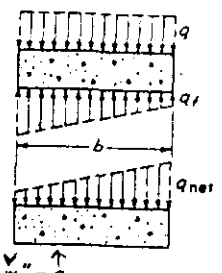
(a)

(b)



$q_s = \frac{W_s + W_{cb}}{b}$

$q_b = \frac{P_b \sin\beta}{b}$

$q_b' = \frac{P_b' \sin\beta}{b}$

$q = w'' + q_s + q_b + q_b'$

$q_{net} = q_s + q_b' + q_b + w'' - q_f$

The increase in heel pressure due to the toe moment is:

$w' = \frac{2.4 M_t}{b^2}$ $W' = \frac{2}{3} w' b$

M_t = toe moment value at front face of wall

Note that w' is parabolic but may be approximated as a uniform pressure w''

$w'' = W'/b$

Assume pressures q_b', q_b, and q are constant and uniformly distributed across b.

If $\beta = 0$, there is only q and w'' to consider.

Since w'', q_b, and q_b' are small the design will usually be sufficiently accurate to neglect these pressures.

Figure 12-15 Forces on the heel slab of a counterfort wall as proposed by Huntington (1957).

Example 12-1 Analyze the retaining wall shown in Fig. E12-1*a* for overturning and sliding stability. Note that this wall is backfilled in a limited zone with a cohesive soil. The batter is on the back face of the wall as used by some transportation departments. Most of the output is obtained from running this wall with a computer program. Dimensions shown were optimized by the computer to satisfy stability and strength requirements. The load factor for USD was taken as 1.8 (1) to allow somewhat for cohesive soil and water in tension crack and (2) because of the uncertainty of the earth pressure, since any "Rankine" zone will be partly in fill and partly in original soil.

SOLUTION

Step 1 Find the ϕ' angle for an equivalent cohesionless soil (see Fig. E12-1*b*):

$$q = \gamma H K_a - 2c\sqrt{K_a} = \gamma H K_a'$$

Rankine $K_a = 0.361$ for $\phi = 28°$

$$q = 17.95(6.7)(0.361) - 2(19.12)(0.60)$$

$$= 43.42 - 22.97 = 20.45$$

The foundation selected will not work for condition 3 if the uplift force from water beneath the footing is as assumed in the previous calculations.

At the time of these calculations a seepage analysis had not been preformed by the design engineer for the dam, Steve Roberts. I discussed the affect water pressure under the retaining wall had on the footing size regid. We decided to provide a drain beneath the footing to relieve water which would seep into the area beneath the footing and a cutoff wall ~10' deep upstream of the spillway. Since water is only temporarily impounded, ~~in this dam~~ these measures seem reasonable to eliminate uplift from water on the retaining wall for panel A.

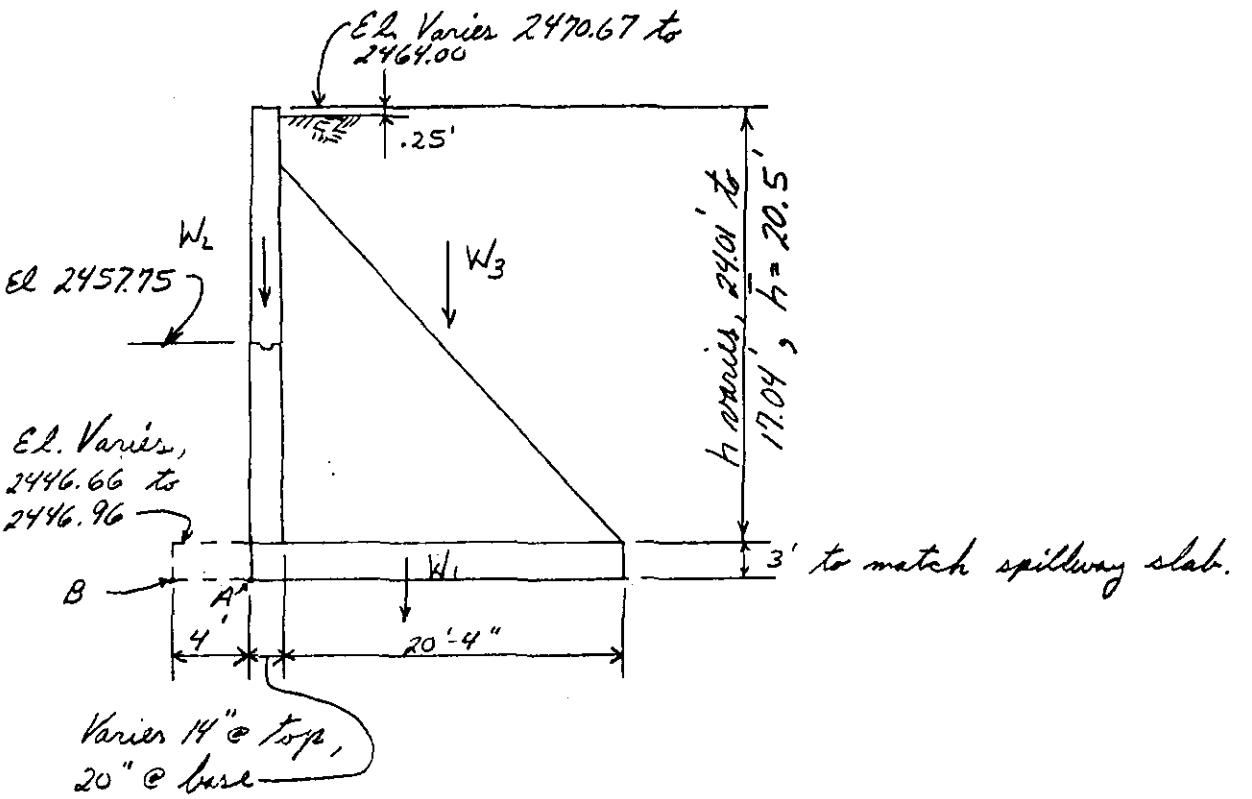
Panel C - Condition 4:

$e = 1,246,026 - 455,570 / 98,670 = 8.01'$ from A or 4.5' from ℄

$e_{allowable} = 25'/6 = 4.2'$ say ok.



$F.S._{OT} = 1,246,026 / 455,570 = 2.74$

$F.S._{Sliding} = 0.77(98,670) / 43,805 = 1.73$

$q = \frac{98,670}{25}\left(1 \pm \frac{4.5\,(6)}{25}\right) = 8,199$ psf ; 0 psf ok.

Soil bearing pressure at edge of footing of the spillway is ~ 3,000 psf. The spillway slab and retaining wall toe abut each other. Both pressures are ≤ 7,000 (1⅓) = 9,333 psf and thus footings are adequate

D. Determine retaining wall dimensions for Panel D:

Toe of Panel D starts 14'-6" from the upstream counterfort. Select a heel width to keep the soil bearing pressure at the wall less than allowable, then check footing pressures with toe.

Based on the results for Panel A & B, check Panel D for load Condition 4 only. See page 1 for a description of the load conditions.

Panel D w/o the toe will be sized for the maximum height, 24', Panel D w/ toe will be checked for a height of 20.5'.

Panel D - Condition 4 Cont'd:

Panel D w/o toe:

$W_1 = 150\,pcf(3')(22') = 9,900^{\#}$ @ 11' from A

$W_2 = 150\,pcf(24')\left(\frac{14+20}{2(12)}\right) = 5,100^{\#}$ @ 0.71' from A = $\frac{14+20}{2(12)}(1/2)$

$W_3 = 125\,pcf(24')(20.33') = 61,000^{\#}$ @ 11.83' from A

$Soil \leftarrow = 90\,pcf(27')^2 1/2 = 32,805^{\#}$ @ 9.00' from A

$\Sigma Vertical = 76,000^{\#}$

$\Sigma Horiz = 32,805^{\#}$

$\Sigma M_R = 834,151^{ft\text{-}\#}$

$\Sigma M_{A\circlearrowright} = 295,245^{ft\text{-}\#}$

$e = 834,151 - 295,245 / 76,000 = 7.09'$ from A or $3.91'$ from E

$e_{allowable} = 22'/6 = 3.67'$ say ok since $FS_{OT} > 2$.

$F.S._{OT} = 839,151 / 295,245 = 2.83$

$F.S._{sliding} = 0.77(76,000) / 32,805 = 1.78$

$q = \frac{76,000}{22}\left(1 \pm \frac{3.91(6)}{22}\right) = 7,138\,psf, 0\,psf.$

∴ Eccentricity controls, use a footing w/ a 20:4" heel (22' overall).

Panel D - Condition 4 Cont'd:

Panel D w/ toe:

$W_1 = 150\,pcf\,(3')(26') = 11{,}700^{lb}$ @ 13' from B

$W_2 = 150\,pcf\,(20.5')\left(\frac{14+20}{2(12)}\right) = 4{,}356^{lb}$ @ 4.71' from B = $4' + \left[\left(\frac{14+20}{2(12)}\right)\frac{1}{2}\right]$

$W_3 = 125\,pcf\,(20.25')(20.33') = 51{,}469^{lb}$ @ 15.83' from B

$Soil \leftarrow = 90\,pcf\,(23.25)^2(\frac{1}{2}) = 24{,}325^{lb}$ @ 7.75' from B

$\Sigma Vertical = 67{,}525^{lb}$

$\Sigma Horiz = 24{,}325^{lb}$

$\Sigma M_{B\circlearrowright} = 987{,}371\ ft\text{-}lb$

$\Sigma M_{B\circlearrowleft} = 188{,}521\ ft\text{-}lb$

$e = 987{,}371 - 188{,}371 / 67{,}525 = 11.83'$ from B or $1.17'$

$e_{allowable} = 4.33$

$F.S._{OT} = 987{,}371 / 188{,}521 = 5.24$

$F.S._{sliding} = 0.77(67{,}525)/24{,}325 = 2.14$

$q = \frac{67{,}525}{26}\left(1 \pm \frac{1.17(6)}{26}\right) = 3{,}298\,psf,\ 1{,}896\,psf$

∴ Footing selected is okay.
