The hydrologic model utilized was the Flood Hydrograph Package (HEC-1) developed by the U.S. Army Corps of Engineers, Hydrologic Engineering Center. HEC-1 is a rainfall-runoff event simulation model which uses an interconnected system of hydrologic and hydraulic components to simulate the surface runoff response of a drainage area to precipitation. This package has been used in many previous studies in the Las Vegas Valley, including the Master Plan and the Corps of Engineers Feasibility Study.

The Clark County Regional Flood Control District (CCRFCD) procedure for determining rainfall amounts and distributions was used to develop estimates for the 10-, 25-, 50- and 100-year storms. Hydrometerological Report No. 49 (HMR-49) was used to develop the estimated rainfall for the probable maximum precipitation (PMP) event.

The USDA Soil Conservation Service (SCS) curve number methodology was used to estimate loss rates because it provides a deterministic method based on soil type and cover. The SCS dimensionless unit hydrograph methodology was used to develop runoff hydrographs for predominantly undeveloped subbasins north of Interstate 15 and east of the developed metropolitan area. The kinematic wave overland flow plane methodology was used to generate hydrographs for developed subbasins.

Kinematic wave flood routing was used to route flow along channel segments having well defined channels. The Muskingum method was used for routing flows across alluvial fans and in subbasins with poorly defined or undersized channels. Little attenuation is expected when using the kinematic wave method which is consistent with flow through well defined, adequately sized channels. In other channel reaches, overbank storage effects are considerable and can best be accounted for through use of the Muskingum method.

The model was then calibrated by adjusting the curve numbers through modification of the Antecedent Moisture Condition assumptions until the regionally-calibrated Corps of Engineers computed probability discharge estimates were achieved.

BASIN CHARACTERISTICS

Subbasin Delineation

The watershed was delineated and subdivided into 38 separate subbasins ranging in area from approximately one-half to ten square miles. The subbasin locations are presented in Figure II-1. Individual subbasin areas, in addition to other information, have been tabulated in Table II-3. Subbasin boundaries and their designation are generally based upon delineations and names used by the Corps of Engineers (COE) Feasibility Study and the CCRFCD Master Plan. Boundaries were adjusted and new subbasins added to provide a more detailed simulation of watershed response.

FIGURE II-1

Hydrologic points of interest (nodes) such as confluences, possible structure locations and outfall points were identified. A schematic diagram of the subbasins, nodes and routing links is presented in Figure II-2.

Precipitation

Point precipitation values were obtained for the 10-, 25-, 50-, and 100-year recurrence interval storms using the NOAA Atlas 2, "Precipitation - Frequency Atlas of the Western United States, Volume VII - Nevada", (NOAA Atlas) as presented in the Draft Rainfall for the Clark County Regional Flood Control District Area manual (Draft CCRFCD manual). Table II-1 lists the NOAA point precipitation values for each recurrence interval storm by subbasin.

In accordance with procedures outlined in the Draft CCRFCD Manual, point precipitation values were modified to account for rainfall records not available at the time of NOAA Atlas publication. The COE, Los Angeles District (LACOE) developed ratio adjustments for various recurrence intervals which were used to modify the NOAA values to arrive at the point rainfall values used as the basis for model simulation precipitation. The ratios are listed in Table II-2.

Temporal and Areal Rainfall Distribution

The 6-hour design storm duration was chosen for modeling purposes. This storm duration represents the local storm generally accepted for detention facility sizing and, because of the rainfall distribution, also results in acceptable peak flow estimates.

Five different storm distributions, each assigned a Storm Distribution Number (SDN), have been developed by the LACOE. The appropriate SDN was utilized based on the size of the contributing drainage area and storm recurrence interval. SDN 5, the least intense distribution, was used for all analyses since even the partial basin simulations included a drainage area consistent with the SDN 5 distribution assumption.

The rainfall depths listed in Table II-1 represent NOAA point rainfall values. The NOAA point rainfall values were increased to reflect the Table II-2 ratios and further adjusted to areal rainfall values using Depth Area Reduction Factors (DARF) from the CCRFCD manual for each specific storm areal extent and location.

Several rainstorms were evaluated to estimate peak flows from storms of different areal extent located over different portions of the basin. The DARF was adjusted to reflect tributary subbasins and only appropriate sub-basins were modeled in each storm simulation. To

represent a rainstorm over the entire basin, "Total Basin Storm", a DARF equal to 0.62 was used to reduce the point precipitation values over all subbasins. This storm also was used to simulate peak flows at the confluence of the Eastern and Western tributaries.

The "Upland Storm" simulation represents a rainstorm over the upland part of the basin which is tributary to the proposed detention facility sites identified in the Master Plan for each tributary. This consists of the currently undeveloped portion of the basin. This area is also above the probable development limits and is expected to remain largely undeveloped due to the mountainous terrain. A DARF of 0.72 was used in the simulation to adjust rainfall in each tributary above the identified detention basin sites.

The "Tributary Basin Storm" represents a storm located over each tributary. A DARF of 0.68 was used for this simulation and represents rainfall over each tributary basin individually. This storm is intended to represent the maximum flows in each tributary and can be used to determine the temporal distribution of runoff from each tributary.

The final storm "Lower Basin Storm" represents a rainstorm over the lower portion of the basin. This area is subject to intense development and potentially high unit runoff. For this simulation, it was assumed that no rainfall occurs in the upper portion of the basin and that the lower watershed is the only contributor of runoff. A DARF of 0.69 was used to simulate this storm.

Figure II-3 presents the coverage of the various storms in a schematic manner.

Probable Maximum Precipitation

The probable maximum precipitation estimate was determined using HMR-49, titled "Probable Maximum Precipitation Estimates, Colorado River and Great Basin Drainages", prepared by the U.S. Department of Commerce and the U.S. Department of Army, reprinted in 1984. The local storm procedure was used to develop the amounts and distribution for the 6-hour probable maximum precipitation (PMP) for both 40 square-mile basins above the two identified detention facility sites. The 6-hour precipitation of 10.35 inches was applied to each subbasin in the probable maximum flood (PMF) analysis.

RANGE WASH
STORM SCHEMATIC

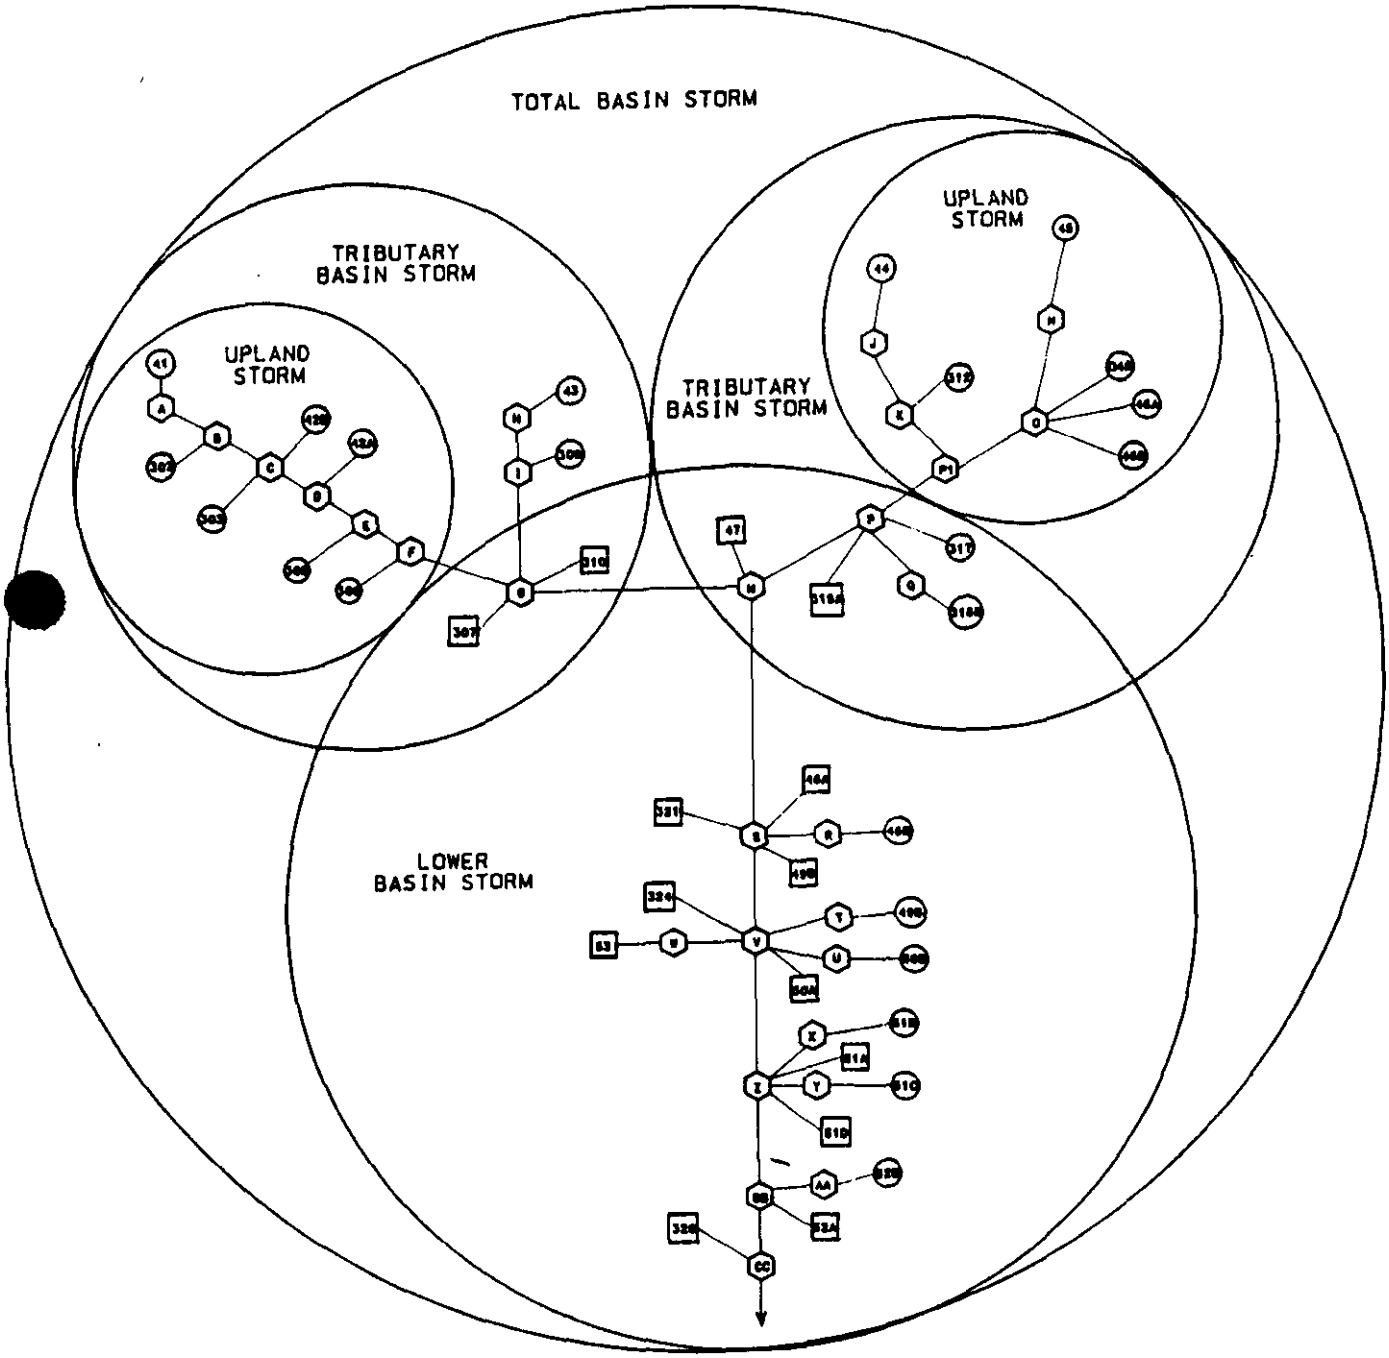

FIGURE II-3

SUBBASIN INPUT PARAMETERS

Curve Numbers and Loss Rates

Vegetative interception, depression storage, and infiltration are collectively referred to in the HEC-1 model as precipitation losses. The SCS curve number method was selected for use in estimating those losses. In this method, losses are related to the drainage characteristics of the soil and the land cover using the curve number, and are a function of the rainfall depth at each time step. Curve numbers were assigned to each subbasin based upon their predominant soil type, land use, type and quality of vegetation, and degree of development. The hydrologic soils group for the soils within the watershed are depicted on Figure II-4. These curve numbers represent runoff conditions assuming antecedent moisture condition (AMC) 2, the average condition. AMC 2 curve numbers for each subbasin are presented, along with other parameters, in Table II-3.

For subbasins modeled using the SCS Unit Hydrograph procedure, AMC 2 curve numbers were assigned using hydrologic soil group and cover information provided by Clark County SCS personnel. Composite subbasin curve numbers were developed using a weighted average of individual curve numbers representing different soil types and covers. It was assumed that vegetative cover was "open brush" in fair to poor condition for all undeveloped subbasins which were modeled using this procedure. The resulting curve numbers are consistent with other common cover types such as desert shrub.

Curve numbers (AMC 2) for developed areas were assigned using guidelines in "Urban Hydrology for Small Watersheds" (TR-55) by the Soil Conservation Service. Curve number for the kinematic wave basins were assigned using a procedure similar to that used in the SCS subbasins. For pervious areas, a composite curve number was developed using a weighted average of individual curve numbers for different soil types and, vegetation types and, densities.

The impervious percentage of each subbasin was estimated based on the degree and type of development. For SCS Unit Hydrograph subbasins, the impervious area was used in the development of the composite subbasin curve number. This method was chosen over entering the percent impervious in the model since the SCS Unit Hydrograph methodology assumes impervious areas are directly connected to the outfall and produce instantaneous runoff. In the watershed, the impervious areas are distributed and frequently flow across pervious lands. Modifying the curve number more uniformly distributes the impervious areas over the entire

subbasin. For kinematic wave subbasins the actual impervious area percentage is used as an input parameter. An AMC 2 curve number of 98 was used for impervious areas.

Unit Hydrograph Parameters

The SCS Unit Hydrograph runoff option in HEC-1 requires input of the SCS lag, which is equal to the time in hours between the center of mass of rainfall excess and the peak of the unit hydrograph.

The SCS curve number method, as presented in the SCS National Engineering Handbook, Section 4 - Hydrology, was used for calculating lag time. In this method, lag time is a function of the hydraulic length, the slope of the watershed, and the subbasin curve number. The following equation was used to calculate subbasin lag times:

$$L = \frac{l^{0.8}\,(s + 1)^{0.7}}{1900\,Y^{0.5}}$$

Where:

L	=	lag in hours	
l	=	hydraulic length of watershed in feet	
s	=	$\frac{1000}{CN} - 10$	where CN is the subbasin curve number
Y	=	*average watershed land slope in percent.*	

This equation was used to represent basin lag rather than other equations (e.g. the COE lag equation) because of its application to generally undeveloped subbasins. The COE method, provided comparable lag times in the upper watersheds but resulted in significantly shorter lag times in the flat undeveloped subbasins on the fan. The SCS equation, having been developed for flatter agricultural and range lands, was more representative for use in this study. Developed subbasins for which the SCS equation may not be as applicable are modeled using the kinematic wave overland flow methodology which does not require the input of lag times.

Values for l and Y were determined from USGS 7.5 minute quadrangle maps. Table II-3 presents the calculated lag time.

Kinematic Wave Parameters

For determination of subbasin runoff using the kinematic wave option in HEC-1, information is required about overland flow planes, collector channels and a main channel. Both pervious and impervious overland flow elements are provided to represent runoff from the subbasin area. Sub-collectors, collectors, and the main channel represent the drainage network in the subbasin. For subbasin runoff generation, basin area, percentage of the area that is impervious, and the length, slope and roughness of pervious and impervious overland flow planes are required input. Percent impervious for each subbasin is presented in Table II-3. Runoff from these flow planes is routed through the drainage network. Parameters used for routing are channel length, slope, roughness, cross-sectional geometry and the contributing area to a typical sub-collector or collector. The kinematic wave parameters were estimated from the USGS 7.5 minute quadrangle maps.

In general, the impervious areas were modeled as having an overland flow length of approximately 50 feet for residential development, to reflect flow length from roof to street flow-line, and 300 feet in commercial and industrial developments, which represents significant parking lot overland flow. A roughness coefficient of 0.1 was used to represent shallow overland flow across impervious areas.

Pervious surface overland flow lengths range between 600 and 800 feet and reflect lawn flow in developed areas or overland flow prior to gully formation in undeveloped areas. A roughness coefficient of 0.2 was used for undeveloped areas and 0.3 for developed lawn areas.

Collector systems in undeveloped areas consisted of small washes. These were modeled in a manner consistent with COE's model using small trapezoidal sections. Developed area collector systems included street sections or improved channels and were modeled to represent actual physical geometry.

FLOOD ROUTING

The kinematic wave flood routing option was used for routing links having well defined, adequate channels. This assumes that there is little floodplain or channel storage and that slopes are steep resulting in the energy grade line slope equalling the ground slope. In areas where this assumption is not appropriate, particularly across the alluvial fan and in developed areas where the drainage system is undersized, the Muskingum storage routing method is

used. This method assigns a storage factor to account for the expected attenuation of flows. This study uses the COE values as initial estimates with modification to reflect changes in subbasin delineation and character. Values range from 0.15 for channel reaches across the fan which have some storage in the overbank but few obstructions, to 0.10 for inadequate channels in developed basins where overbank flows would encounter numerous obstructions and consequently be significantly attenuated.

Kinematic Wave Flood Routing

The kinematic wave approach to channel routing requires the estimation of channel lengths, slopes, average bottom widths, side slopes, and Manning's "n" values. Channel lengths and slopes were estimated from the USGS 7.5 minute quadrangle maps. Average bottom widths, side slopes and "n" values were estimated from mapping, construction drawings, former studies and observations. Length and slope for each routing link, including Muskingum reaches, are presented in Table II-4.

Muskingum Flood Routing

The Muskingum approach to flood routing requires estimation of coefficients that reflect flood wave travel time and channel storage. The "K" factor which approximates flood wave travel time was estimated by the COE in their Feasibility Study. This value is dependent upon length, computational interval and estimated velocity. The "X" values were assigned based on the relative importance of channel storage, with 0.10 for significant storage and 0.15 for lesser degrees of storage. X values for each routing link are presented in Table II-4.

BASIN DEVELOPMENT

The hydrologic analysis was performed for both existing basin development and future basin development. Existing conditions reflect present land use and development currently underway. This level of development is generally unchanged from that presented in the Master Plan.

Future conditions refers to the projected extent of development within the Study Area by the year 2055. It represents ultimate development as foreseen today. The boundary of future development was determined using projections from several sources. The boundary used by the COE in their Feasibility Study was adjusted using information from the City of North Las Vegas's Land Use Plan and the Economic Development Department regarding areas of future development in and around the City. COE development limits and those used in this study are shown on Figure II-5. Zoning information from the Clark County Comprehensive Planning Department was used to identify the type and extent of future development.

Future Basin Model

Using the information regarding future land use type and extent, estimates were made of the future amounts of impervious surface, future curve numbers, and changes to the kinematic wave runoff parameters. Future development will increase the amount of impervious surface within a subbasin. The SCS unit hydrograph methodology was selected for basins that would remain generally unchanged after development and therefore model changes were generally nominal and resulted in minor, or no, changes in the curve number. For subbasin 306, the future development scenario calls for virtually full development of a currently undeveloped basin. Runoff characteristics of this basin changed considerably reflecting the significant change between the present and future condition.

In kinematic wave subbasins, increased development resulted in an increase in the percentage of the basin modeled as impervious. In some cases, when the dominant type of development charged, the overland flow characteristics were also changed to reflect altered flow lengths and flow characteristics. Where there was a significant degree of development proposed in a watershed, the pervious area curve number was adjusted downward to reflect a better vegetative cover which would result from improved watering and maintenance. Table II-3 presents the future percent imperviousness and curve numbers.

CALIBRATION

Comparison with Past Studies

Prior to calibration, simulation was performed for the 100-year storm using the parameters as discussed above for the present and future development conditions. The resultant peak flows at the Range Wash Outfall to Las Vegas Wash were 10,880 cfs and 11,380 cfs for the present and future conditions respectively. Table II-5 presents a comparison of Boyle's initial peak flows at the Range Wash Outfall with those simulated by the COE in both their Computed and Expected Probability analyses, and with those from the CCRFCD Master Plan.

The Eastern and Western Tributaries of Range Wash and Range Wash itself are ungaged streams. There is little historical data available for use in calibrating peak flows in a computer model. There are however, several earlier hydrologic studies which attempted to utilize regional calibrated flood events. The most extensive historical and regional analysis was done by the COE as part of their Feasibility Study. The COE conducted an analysis of 36 stations in the California-Nevada desert area with record lengths of greater than 10 years. Using a flood-flow frequency analysis on this data, they developed a regional 100-year peak flow versus drainage area relationship for the Las Vegas Valley. The result of this analysis is a curve which provides a generally accepted range of flow for larger areas. While this curve lumps several hydrologically different watersheds together, the curve does represent an estimate against which to check the reasonableness of values determined via modeling. Values from this curve are presented in Table II-5 as the Regional Curve Unit Peak Flow.

The COE used the earlier Master Plan model framework as the basis for their computer modeling of the Las Vegas Valley. They developed both Expected and Computed Probability discharge estimates, each based on separate and different statistical assumptions about the data and their reliability. Local governments in the Las Vegas Valley have adopted the Computed Probability estimated flows for regulation purposes within their jurisdictions.

As Table II-5 demonstrates, Boyle's initial peak flow estimates fall between the COE's Expected and Computed Probability estimates and correlate well with the COE regional curves.

TABLE II-5

COMPARISON OF INITIAL SIMULATION RESULTS RANGE WASH OUTFALL

Drainage Study and Point of Comparison	Drainage Area (sq. mi.)	Estimated Peak Flow (cfs)	Calculated Unit Peak Flow (cfs/sq. mi.)	Regional Curve Unit Peak Flow (cfs/sq. mi.)
Initial Boyle Node CC - present	150.8	10880	72	70
Initial Boyle Node CC - future		11380	75	70
COE-C CP1 - present	156.3	8000	51	70
COE-C CP1 - future		8350	53	70
COE-E CP1 - present	156.3	12000	77	70
COE-E CP1 - future		12500	80	70
M.P. RW-326	156.3	16410	105	70

"Initial Boyle" refers to this study before calibration.

"COE-E" refers to Corps of Engineers Feasibility Study, Expected probability flows.

"COE-C" refers to Corps of Engineers, Special Flood Hazard Study, Computed probability flows.

"M.P." refers to CCRFCD Master Plan, Ultimate Development Flows.

In evaluating the differences between the study results presented in Table II-5, several factors appear to be relevant. First, the input parameters for the COE study and Boyle's study are based on many of the same physical assumptions. Routing parameters, subbasins, and routing structure are very similar. The approaches used to model loss rates, however, are different. The COE feasibility study used a constant loss rate whereas Boyle used the SCS curve number method. This has the effect of moderating Boyle's subbasin peak flows since peak losses occur at the time of peak rainfall rather than being constant. Boyle's model also provides a more site specific representation of factors affecting runoff peaks than does the COE model.

Another significant difference in the simulation efforts is the rainfall used in the models. The COE and Boyle used different depth area reduction factors to modify the point precipitation. COE used a DARF developed by their meteorologists which results in a divergence of rainfall

amounts for areas over 100 square miles. This DARF curve is inconsistent with the curve presented in HYDRO-40 which is the generally accepted methodology within the Las Vegas Valley. For comparative purposes, Boyle used the COE DARF in the initial model developed for this study and achieved results comparable to the COE computed probability values.

Calibration

The COE calibrated their expected and computed probability model to the peak flow estimates developed from a statistical evaluation of regional gages. This approach forced COE to utilize the same constant loss rate throughout the Valley regardless of soil type or cover.

Calibration of Boyle's model to the COE computed probability peak flows was accomplished in a manner comparable to that used by COE. The Antecedent Moisture Condition (AMC) reflected in the curve numbers was adjusted, thereby effectively changing the losses throughout the watershed. This results in a match of the target computed probability value while maintaining the models ability to reflect varying basin soil and cover characteristics. Curve numbers used in the calibrated present development condition model represent an AMC of 1.8. Calibrated curve numbers are presented in Table II-6. A curve number of 97 was used for impervious areas rather than the 98 used in the initial model.

The projected limits of future development differ between the COE model and Boyle's model. In order to calibrate the Boyle future development model, the future development limit used in the COE model was modeled in Boyle's model. The curve numbers were adjusted by AMC revision until the peak flow at the outfall matched the COE Computed Probability estimate. Calibration of the future condition model resulted in the use of curve numbers representing an AMC of 1.8. The expanded development limits were then introduced into Boyle's model to reflect the information received from the City of North Las Vegas.

SIMULATION RESULTS

Simulations were performed for the 10-, 25-, 50- and 100-year rainfall events for both present and future levels of development. These simulations were run for the temporal and areal rainfall distributions discussed earlier: 1) DARF of 0.62 for the "Total Basin Storm"; 2) DARF of 0.72 for the "Upland Storm" used to model the tributaries to the Master Plan detention ponds; 3) DARF of 0.68 for the "Tributary Basin Storm" above the confluence of the Eastern and Western tributaries; 4) DARF of 0.69 for the "Lower Basin Storm", and; 5) the PMP. the resulting peak discharges and volumes for the identified points of interest on East Range Wash, West Range Wash, their confluence and the Range Wash Outfall. The simulated 100-year peak discharges at the Range Wash Outfall for the present and future development conditions, respectively, are 8,040 and 8,870 cfs. Figures II-6 through II-9 present graphical representation of the 100-year present and future development hydrographs.

SEDIMENT YIELD ANALYSIS

Methodology

The sediment yield analysis of the Range Wash Study Area was performed using the Pacific Southwest Interagency (PSIA) methodology. This methodology is intended for broad planning purposes rather than specific project planning. The PSIA methodology considers climate and physical factors of the area, as well as evidence of past erosion, to determine a sediment yield classification for the area in question. The factors consideration: geology, soils, climate, runoff, topography, ground cover, land use, upland erosion, and channel erosion and sediment transport. The factors are each assigned a numeric value based on information obtained from a rating which is used to estimate unit sediment yield.

Basin Discretization

Three watershed subdivisions were selected for analysis using the PSIA methodology: Western Range Wash tributary to the detention facility identified in the master plan (Node F of the Hydrologic analysis); Eastern Range Wash tributary to the detention facility identified in the master plan (Node P1 of the Hydrologic analysis), and; both Washes above their confluence (Node M of the Hydrologic analysis).

Factors Affecting Sediment Yield

The sediment yield analysis factors are summarized below:

Surface Geology: The exposed rock of the study area is predominantly limestone and dolomite, somewhat fractured and weathered. Rock is only exposed in the steep upland areas.

Soils: Soils of the area are generally very gravely with a distinct erosion pavement. Soil material is fine sandy loam with occasional caliche layers and high percentage of rock

fragments. A larger extent of caliche was found near the surface in the Eastern Range Wash area than in the western area.

Climate: The Las Vegas Valley has an arid climate with infrequent convective storms and little freeze-thaw occurrence.

Runoff: The Range Wash watersheds produce moderate runoff peak flows and volumes.

Topography: The steep upland slopes have high relief with extensive alluvial fan development at their base. A larger percentage of the western tributary has steep slopes than of the eastern tributary.

Ground Cover: Vegetative ground cover is less than 20 percent. An extensive erosion pavement of rock fragments covers most of the study area.

Land Uses: The majority of the study area is virtually undisturbed except for occasional roads, and mining exploration.

Upland Erosion: The erosion pavement is evidence of upland erosion as are the numerous rills and gullies on the alluvial fans.

Channel Erosion and Sediment Transport: Eroding channel backs are evident where flow is collected either naturally or by man caused means (e.g., roads). Flow is intermittent and of short duration. The eastern tributary is channelized to a slightly higher degree than the western tributary area. The fan above the western ponding area has no well defined channel.

Results

The factors described above were assigned a numeric value representing their relative contribution to the sediment yield of the part of the basin in question. These numeric values were summed and a rating was established. Using curves provided by the PSIA methodology, a unit sediment yield was estimated.

Table II-8 presents a summary of the numeric values assigned to each analysis factor and an estimate of the total average annual sediment production which can be expected at each point of interest.

TABLE II-8

SEDIMENT YIELD ANALYSIS SUMMARY

	Western Tributary	Eastern Tributary	Confluence
PSIA Factor Ratings			
Geology	2	2	2
Soils	7	5	6
Climate	2	2	2

Upland Erosion	12	10	10
Channel Condition	10	18	15
Summary Ratings	42	43	38
Unit Sediment Yield (af/sq mi/yr)	.40	.42	.37
Drainage Area (sq mi)	41	40	133
Sediment Yield			
Estimated Average Annual Sediment Yield (af/yr)	16	17	49

Comparisons with Past Studies

The average annual sediment yield for the three watershed subdivisions is estimated to range from 0.37 af/sq.mi./yr to 0.42 af/sq.mi./yr. The COE feasibility study developed, and presented, a curve of estimated average annual sediment delivery rates to detention basins within the Las Vegas Valley. These curves present sediment delivery per year per square mile versus basin area for areas similar to those found in Range Wash. The COE Feasibility Study

estimates were 0.35 af/sq.mi./yr to 0.40 af/sq.mi./yr. This is very close to the values determined in this effort. Differences may be attributed to slightly higher rainfall in the Range Wash watershed than in the Valley as a whole.

Design Storm Sediment Volume

The estimated average annual sediment yield for the Range Wash basin must be converted to a design storm value to be used for channel and other conveyance facility sizing purposes. A review of several studies performed on similar basins in Clark County, Nevada, Mohave County, Arizona and in Southern California indicated that the 100-year sediment volume is generally between four and seven times the average annual volume.

These values were developed primarily using two methods. One method was to develop a *Modified Universal Soil loss estimate of sediment delivery for each recurrence interval storm* and then integrate over all storm frequencies to establish an average annual sediment delivery volume. The other methodology was to develop an estimate of the sediment yield and sediment transport capacity for each recurrence interval storm and then integrate over all storms to develop an average annual sediment delivery volume.

The ratio of 7 is from a general reference and does not reflect the same level of analysis as the other references. The range of ratios presented in the other reports is between 4 and 5.6 for the 100-year to the average annual. A composite average of 5.26 has been adopted for this study.

Using the adopted 5.26 relationship between the 100-year storm volume and the average annual volume as presented in Table II-8, a 100-year storm sediment volume is computed. Table II-9 presents the estimated 100-year sediment volume.

TABLE II-9

100-YEAR SEDIMENT DELIVERY

	Western Tributary	Eastern Tributary	Confluence
Unit Sediment Yield (AF/Mi^2)	2.1	2.2	1.9
100-Year Sediment Yield (AF)	86	88	260

The distribution of this sediment during the hydrograph duration is based on a linear relationship to the discharge rate. Studies have indicated that the relationship of sediment flow to discharge may also follow a power function, however, without calibration, there is no evidence that a power function provides a better representation and is therefore not used in this study. This distribution can be interpreted as a bulking factor by which clear water discharges can be adjusted to reflect sediment volume.

Using the runoff volumes presented in Table II-7 for the 100-year storm under present basin conditions for each tributary and for the entire basin, the sediment volume constitutes an increase of between 7 and 11%. For this study, a bulking factor of 11% will be utilized for the design of hydraulic facilities subject to sediment laden flows. Facilities below debris basins or other sediment control facilities will use clearwater discharge assumptions.

100-YR, 6-HR STORM ARF = 0.72
PRESENT CONDITIONS, EXISTING FACILITIES
JULY 1989
BOYLE ENGINEERING CORPORATION
SUB-AREA A -- 40.7 SQ MI
CALIB. TO COE, AMC 1.8 (309,317 AMC 1.79)

9 IO OUTPUT CONTROL VARIABLES

IPRNT	5	PRINT CONTROL
IPLOT	0	PLOT CONTROL
QSCAL	0.	HYDROGRAPH PLOT SCALE

IT HYDROGRAPH TIME DATA

NMIN		5	MINUTES IN COMPUTATION INTERVAL
IDATE	1	0	STARTING DATE
ITIME		0000	STARTING TIME
NQ		200	NUMBER OF HYDROGRAPH ORDINATES
NDDATE	1	0	ENDING DATE
NDTIME		1635	ENDING TIME

COMPUTATION INTERVAL .08 HOURS
TOTAL TIME BASE 16.58 HOURS

ENGLISH UNITS

1

U.S. ARMY CORPS OF ENGINEERS, THE HYDROLOGIC ENGINEERING CENTER, 609 SECOND STREET, DAVIS, CA. 95616

****

EAST AND WEST RANGE WASHES
100-YR, 6-HR STORM ARF = 0.62
FUTURE CONDITIONS, EXISTING FACILITIES
JULY 1989
BOYLE ENGINEERING CORPORATION
LOWER PORTION OF THE BASIN ONLY
AMC 1.8 (309, 317, 305, 303 AMC 1.77)
NEW FUTURE DEVELOPMENT IN 306, 307, 310

10 IO OUTPUT CONTROL VARIABLES

IPRNT	5	PRINT CONTROL
IPLOT	0	PLOT CONTROL
QSCAL	0.	HYDROGRAPH PLOT SCALE

IT HYDROGRAPH TIME DATA

NMIN	5	MINUTES IN COMPUTATION INTERVAL
IDATE	1 0	STARTING DATE
ITIME	0000	STARTING TIME
NQ	200	NUMBER OF HYDROGRAPH ORDINATES
NDDATE	1 0	ENDING DATE
NDTIME	1635	ENDING TIME

COMPUTATION INTERVAL .08 HOURS
TOTAL TIME BASE 16.58 HOURS

ENGLISH UNITS

1

RUNOFF SUMMARY

Subject: Permit J208

Dear Mr. King:

Attached is a copy of "North Las Vegas Detention Basin Outlet Modification Report." The purpose of the study is to investigate the feasibility of modifying the outlet structure at the North Las Vegas detention basin to reduce peak storm water discharges from the detention basin. The City of North Las Vegas contracted Black & Veatch to conduct the study to determine if the storage capacity of the existing basin could be more effectively utilized to further reduce 100-yr flows for numerous drainage and transportation facilities located downstream on the Las Vegas Wash. The existing facility is currently under utilized due to the recent construction of the Upper Las Vegas Wash Detention Basin, located upstream on the Las Vegas Wash, and the soon to be constructed West Range Wash Diversion Dike, located to the north east of the detention basin.

The report recommends closure of two of the five 72 inch outlet pipes. The impact of the outlet modifications on the detention basin is increased basin stage duration and drain time. However, the peak discharge and basin stage produced by the five design storms of 6 hour duration modeled in this study are less than those for the original design hydrology.

Attached to this letter are the following: 1) a copy of your letter, dated September 1, 1993, in which you state a detailed seepage analysis is not required, 2) a copy of the report with the submittal letter to Bob Murnane, the Development & Flood Control Coordinator for North Las Vegas, and 3) three copies of the construction drawings of the outlet modifications. Submittal of a completed application form and the $500 application fee were waived by J. Stephen Folk during our discussions in May 1993.

Mr. Jason King, P.E.

Subject: Outlet Modification Project

Dear Mr. Murnane:

Subsequent to our meeting on August 25, 1993, we received a letter from the Nevada Department of Water Resources, indicating their acceptance of the project. A copy of the letter is attached for your file.

Also attached are six sets of construction drawings and one revised copy of the Outlet Modification Report. Revisions to the report are indicated by a vertical line along the right hand margin.

As always, it has been a pleasure to work with you on this project. If you have any questions regarding this project, please give me a call.

Very truly yours,

BLACK & VEATCH

OVERVIEW

The North Las Vegas Wash detention basin was constructed in 1984, to collect and control stormwater runoff from the northern Las Vegas Wash watershed. In recent years, the Clark County Regional Flood Control District (CCRFCD), has developed a Master Plan for proposed construction of additional flood control facilities throughout the Las Vegas Valley. Included in CCRFCD's Master Plan are the Upper Las Vegas Wash detention basin and the Range Wash Diversion dike. Construction of the Upper Las Vegas Wash detention basin was completed in July, 1993. The forecasted completion date for construction of the Range Wash Diversion dike is January, 1994. The construction of these two facilities will result in "structural changes" to the northern Las Vegas Wash watershed that impact stormwater flows at the existing detention basin.

In addition, CCRFCD adopted standard hydrologic procedures and developed drainage and hydrologic policies for the design of Master Plan flood control facilities. These hydrologic procedures are different than those originally used for the design of the North Las Vegas Wash detention basin. As a result, the anticipated stormwater flows today are likely different than those at the time of design.

The purpose of this study is to investigate the feasibility of modifying the outlet structure at the North Las Vegas wash detention basin to reduce peak stormwater discharges from the detention basin. Decreased peak discharges will reduce the cost of channel improvements and bridge replacement along the Las Vegas Wash in North Las Vegas and Clark County.

This study consists of hydrologic modeling for six 100-year storm centerings located upstream of the North Las Vegas Wash detention basin. The areal extent of the storms range from 48 to 160 square miles. For each of the six storms, reservoir stage, storage and peak discharge were determined for existing and modified outlet conditions.

NORTH LAS VEGAS WASH DETENTION BASIN

The North Las Vegas detention basin is located in Section 14, Township 19 South, Range 61 East, of Clark County. The detention basin was designed by James M. Montgomery Engineers (JMM), for the City of North Las Vegas in 1983. The facility was constructed in 1984.

Photo 1 - Outlet Structure at North Las Vegas Wash Detention Basin.

The outlet works at the North Las Vegas detention basin includes both low flow and auxiliary discharge facilities. The low flow outlet consists of five 72 inch diameter concrete pipes as shown in Photo 1. The auxiliary outlet is an ogee spillway overflow section with a length of 100 ft and crest elevation of 2134.0. The storage capacity of the detention basin at the spillway crest elevation is 1,440 acre-ft. The stage-discharge and stage-storage information for the outlet facilities and detention basin were obtained from JMM record drawings for the project. The stage-discharge relationship for the low flow and auxiliary outlets and the stage-storage relationship for the detention basin are provided in Appendix A.

HYDROLOGIC ANALYSIS

Rainfall runoff response simulation and flood routing for the six storm centerings was modeled using the U. S. Army Corps of Engineers HEC-1 computer program, Version 4.0. Models for the SP and LC storm centerings are based on existing models developed by JMM for the *Las Vegas Valley Flood Insurance Study (FIS)*. The remaining models are based on work performed previously by Black & Veatch for the *Flood Control Facilities Plan for the*

Northern Las Vegas Wash, Transbasin Diversion Hydrologic Evaluation and the *Predesign report for the Upper Las Vegas Wash Detention Basin*. All models include minor revisions to incorporate the final design data for the Upper Las Vegas Wash detention basin. In addition, routing revisions were required in all but the *FIS* models due instabilities associated with the kinematic wave routing algorithm of HEC-1, Version 4.0. For each storm centering the North Las Vegas detention basin was modeled with the existing five pipe outlet, and modified 3 and 4 pipe outlets for comparison. A brief description of each model is listed below. Storm data, inflow, outflow and maximum basin stage for each storm centering are listed in Table 1. Hydrograph and basin stage vs. time plots for each storm are shown on Figures 1 through 6.

Spring Mountain Storm (SP) - Existing *FIS* model for 136.34 square mile storm centered over the Spring Mountain Range. All subbasin runoff routed through the Upper Las Vegas Wash detention basin.

Lower Central Valley Storm (LC) - Existing *FIS* model for 60.65 square mile storm centered between the Upper Las Vegas Wash detention basin and the North Las Vegas detention basin. Subbasin runoff from 20.52 square miles routed through the upper basin with the remaining 39.48 square miles directly tributary to North Las Vegas basin.

Transbasin B5 Storm (TB5) - Model from *Transbasin Diversion Hydrologic Evaluation*. A 99.62 square mile storm centered over the southern Sheep Mountains and abutting alluvial fans. Areal extent of storm is split between two watersheds with 51.45 square miles tributary to the Las Vegas Wash and 48.17 square miles tributary to the Range Wash. Subbasin runoff from 20.52 of the 51.45 square miles tributary to the Las Vegas Wash routed through the upper basin. Subbasin runoff from the western Range Wash diverted by the Range Wash diversion dike to the North Las Vegas detention basin.

Sheep Mountain Storm (TBS) - Model from *Transbasin Diversion Hydrologic Evaluation*. A 159.25 square mile storm centered over the central Sheep Mountains. All subbasin runoff routed through the Upper Las Vegas Wash detention basin.

Range Wash Storm (RW) - Portion of the TB5 model from *Transbasin Diversion Hydrologic Evaluation* used by Boyle Engineers Inc., for the design of Range Wash Diversion project. A 48.17 square mile storm over the western portion of the range wash watershed. All subbasin runoff is diverted by the Range Wash diversion dike to the North Las Vegas detention basin.

Interbasin Storm (F) - Model from *Predesign Report for the Upper Las Vegas Wash Detention Basin*. A 54.37 square mile storm centered between the Upper Las Vegas Wash detention basin and the North Las Vegas detention basin. All subbasin runoff directly tributary to the North Las Vegas basin.

DISCUSSION OF RESULTS

The original hydrologic design data for the North Las Vegas Wash Detention Basin is unavailable. However, review of the JMM record drawings indicates that the detention basin design storm was a 3 hour, 100-year event. The design storm produced a maximum basin stage of 28.0 ft (El. 2136.0), which resulted in a peak discharge of approximately 4,690 cfs. This design storm resulted in auxiliary spillway operation at a flow depth of two feet above the crest elevation. As shown in Table 1, the peak discharge and basin stage produced by the storms of 6 hour duration modeled in this study are less that those for the original design hydrology. This decrease in stage and discharge may be partially attributed to the more rapid runoff response associated with 3 hour storm events. In addition, the Upper Las Vegas Wash detention basin provides significant hydrograph peak attenuation for the SP, LC, TB5 and TBS storm events. Of the six storms modeled, the Spring Mountain storm (SP), produces the greatest peak discharge and maximum basin stage at the North Las Vegas detention basin.

Closure of one pipe, or the modified 4 pipe outlet reduces peak flows by an average of 420 cfs. The average reduction of peak flows for the 3 pipe outlet is 860 cfs. It is important to note that the SP and S storms both result in auxiliary spillway discharge for the 3 pipe outlet condition. However, the operating head on the spillway is less than that of the original design storm. Due to low head conditions the spillway operation is inefficient, and overall, total discharge from the detention basin is significantly reduced.

As previously mentioned, the SP and LC storm models are based upon CCRFCD's *FIS* models. A comparison of *FIS*, existing condition and modified outlet peak discharges for the North Las Vegas detention basin are listed in Table 2.

TABLE 2

Storm	*FIS* Discharge (cfs)	Existing 5 Pipe Outlet (cfs)	Modified 4 Pipe Outlet (cfs)	Modified 3 Pipe Outlet (cfs)
SP	3,050	3,310	2,970	2,780
LC	2,500	2,920	2,530	2,070

The *FIS* models prepared by JMM are based on the closure of one existing pipe at the North Las Vegas detention basin. As shown in Table 2, detention basin discharges reported by this study for the modified 4 pipe outlet condition are in close agreement with the *FIS* figures.

As a result of modifying the detention basin outlet by closing one or two of the existing pipes, basin stage duration and drain time for each of the 6 storm events will be increased. The drain time for the detention basin for each of the storms based on existing and modified outlet conditions is shown in Table 3.

TABLE 3

Storm	Existing 5 Pipe Outlet	Modified 4 Pipe Outlet	Modified 3 Pipe Outlet
SP	26.7 hrs	29.8 hrs	~34 hrs
LC	17.0 hrs	18.3 hrs	22.5 hrs
TB5	16.5 hrs	19.0 hrs	23.3 hrs
TB5	~30 hrs	~32 hrs	~36 hrs
RW	15.0 hrs	16.8 hrs	20.2 hrs
F	17.5 hrs	20.4 hrs	22.9 hrs

As shown in Table 3, the increase in detention basin drain time due to closure of one pipe ranges from approximately 1 to 3 hours. If two pipes are closed the drain time will be increased by approximately 5 to 7 hours for the various storms.

During the original design of the North Las Vegas detention basin, and embankment seepage analysis was performed by J. H. Kleinfelder & Associates. The Kleinfelder analysis was based on an assumed 24 hour detention time and an embankment permeability greater than $1x10^{-2}$ cm/sec. In their report, dated October 29, 1982, Kleinfelder states that seepage waters do not exit the downstream slope of the embankment and that seepage control measures such as toe and blanket drains are not necessary.

A detailed seepage analysis was not in the scope of this study, but our review of the original soil borings for the project indicates that actual embankment permeability values most likely range from $1x10^{-3}$ to $1x10^{-5}$ cm/sec. It is our opinion that the increased detention times due to closure of one or two of the existing outlet pipes will not result in significant changes, as compared to the original design, in the advancement of seepage or embankment stability factors of safety.

CONCLUSION

Closing one of the five existing 72 inch diameter outlet pipes will attenuate peak discharges from the North Las Vegas detention basin so that actual flows will agree with the modelled *FIS* flows developed for future Flood Insurance mapping. However, we recommend that discharges from the detention basin be reduced even more by closing two of the existing five outlet pipes. This modification will more effectively utilize the storage capacity of the existing detention basin and will further reduce 100-yr peak flows along the Las Vegas Wash for numerous downstream drainage and transportation facilities.

PROJECT LOCATION: NORTH LAS VEGAS DETENTION BASIN, CLARK COUNTY, NEVADA. TOWNSHIP 19 SOUTH, RANGE 61 EAST, SECTION 14.

PROJECT DESCRIPTION: INSTALLATION OF STEEL CLOSURE PLATES OVER 72" DIAMETER OUTLET PIPES.

GENERAL NOTES:

1. CONTRACTOR IS ADVISED TO VISIT SITE PRIOR TO BEGINNING WORK.
2. CLOSURE PLATES SHALL BE INSTALLED ON THE UPSTREAM AND DOWNSTREAM END OF PIPE.
3. CONTRACTOR SHALL VERIFY FIELD DIMENSIONS AND LOCATE EXISTING HEADWALL REINFORCING STEEL AS REQUIRED FOR EXPANSION ANCHOR INSTALLATION.
4. CLOSURE PLATES SHALL BE ASTM A36 STEEL SHOP COATED WITH RED OXIDE PRIMER.
5. EXPANSION ANCHORS SHALL BE HILTI HVA ADHESIVE ANCHOR SYSTEM INSTALLED PER MANUFACTURERS DIRECTIONS. CONTRACTOR SHALL USE 3/4"x9-5/8" HILTI HAS ANCHOR RODS WITH 3/4" HILTI HFA INSERTS. USE ONE 3/4"x6-5/8" HILTI HVA ADHESIVE CAPSULE PER ANCHOR.
6. STEEL FABRICATOR MAY PROVIDE LONG SLOTTED HOLES IN CLOSURE PLATES TO ALLOW FOR FIELD ADJUSTMENT.

Attention: Mr. Walter Hines

Subject: Geotechnical Investigation
Range Wash Flood Control Project
Near Range Road
North Las Vegas, Nevada

Gentlemen:

We are pleased to submit the results of our geotechnical investigation conducted for the construction of the Range Wash Flood Control Project located near Range Road in North Las Vegas, Nevada. The study was performed in general accordance with our signed Standard Form of Agreement With Consultant for Professional Service dated July 29, 1991.

The dike should receive adequate support from undisturbed medium dense to dense granular soils or on moderately hard to hard cemented soils. The on-site soils are suitable for use as materials for soil-cement and dike embankment fill.

Groundwater was not encountered to the depths explored for this project. Hard caliche and/or moderately hard partially cemented soils were encountered at most of the boring and test pit locations at various depths. Rock excavation techniques may be required for excavation of the cemented soils.

If you have questions concerning information contained in this report, please contact us at your convenience.

Respectfully submitted,

CONVERSE CONSULTANTS SOUTHWEST, INC.

IMPORTANT INFORMATION
ABOUT YOUR
GEOTECHNICAL ENGINEERING REPORT

More construction problems are caused by site subsurface conditions than any other factor. As troublesome as subsurface problems can be, their frequency and extent have been lessened considerably in recent years, due in large measure to programs and publications of ASFE/ The Association of Engineering Firms Practicing in the Geosciences.

The following suggestions and observations are offered to help you reduce the geotechnical-related delays, cost-overruns and other costly headaches that can occur during a construction project.

A GEOTECHNICAL ENGINEERING REPORT IS BASED ON A UNIQUE SET OF PROJECT-SPECIFIC FACTORS

A geotechnical engineering report is based on a subsurface exploration plan designed to incorporate a unique set of project-specific factors. These typically include: the general nature of the structure involved, its size and configuration; the location of the structure on the site and its orientation; physical concomitants such as access roads, parking lots, and underground utilities; and the level of additional risk which the client assumed by virtue of limitations imposed upon the exploratory program. To help avoid costly problems, consult the geotechnical engineer to determine how any factors which change subsequent to the date of the report may affect its recommendations.

Unless your consulting geotechnical engineer indicates otherwise, *your geotechnical engineering report should not be used*:

- When the nature of the proposed structure is changed, for example, if an office building will be erected instead of a parking garage, or if a refrigerated warehouse will be built instead of an unrefrigerated one;
- when the size or configuration of the proposed structure is altered;
- when the location or orientation of the proposed structure is modified;
- when there is a change of ownership, or
- for application to an adjacent site.

Geotechnical engineers cannot accept responsibility for problems which may develop if they are not consulted after factors considered in their report's development have changed.

MOST GEOTECHNICAL "FINDINGS" ARE PROFESSIONAL ESTIMATES

Site exploration identifies actual subsurface conditions only at those points where samples are taken, when they are taken. Data derived through sampling and subsequent laboratory testing are extrapolated by geotechnical engineers who then render an opinion about overall subsurface conditions, their likely reaction to proposed construction activity, and appropriate foundation design. Even under optimal circumstances actual conditions may differ from those inferred to exist, because no geotechnical engineer, no matter how qualified, and no subsurface exploration program, no matter how comprehensive, can reveal what is hidden by earth, rock and time. The actual interface between materials may be far more gradual or abrupt than a report indicates. Actual conditions in areas not sampled may differ from predictions. *Nothing can be done to prevent the unanticipated, but steps can be taken to help minimize their impact.* For this reason, *most experienced owners retain their geotechnical consultants through the construction stage*, to identify variances, conduct additional tests which may be needed, and to recommend solutions to problems encountered on site.

SUBSURFACE CONDITIONS CAN CHANGE

Subsurface conditions may be modified by constantly-changing natural forces. Because a geotechnical engineering report is based on conditions which existed at the time of subsurface exploration, *construction decisions should not be based on a geotechnical engineering report whose adequacy may have been affected by time.* Speak with the geotechnical consultant to learn if additional tests are advisable before construction starts.

Construction operations at or adjacent to the site and natural events such as floods, earthquakes or groundwater fluctuations may also affect subsurface conditions and, thus, the continuing adequacy of a geotechnical report. The geotechnical engineer should be kept apprised of any such events, and should be consulted to determine if additional tests are necessary.

GEOTECHNICAL SERVICES ARE PERFORMED FOR SPECIFIC PURPOSES AND PERSONS

Geotechnical engineers' reports are prepared to meet the specific needs of specific individuals. A report prepared for a consulting civil engineer may not be adequate for a construction contractor, or even some other consulting civil engineer. Unless indicated otherwise, this report was prepared expressly for the client involved and expressly for purposes indicated by the client. Use by any other persons for any purpose, or by the client for a different purpose, may result in problems. *No individual other than the client should apply this report for its intended purpose without first conferring with the geotechnical engineer. No person should apply this report for any purpose other than that originally contemplated without first conferring with the geotechnical engineer.*

INTRODUCTION

This report presents the results of our geotechnical investigation performed for the construction of the Range Wash Flood Control Project near Range Road in North Las Vegas, Nevada. A vicinity map showing the location of the project within the Las Vegas area is provided on Drawing No. 1. The purposes of this investigation were to (1) provide geotechnical recommendations for the proposed dike, floodway and inlet structure; and (2) provide recommendations regarding construction requirements and mix designs for soil-cement. The geotechnical portion of our investigation is presented in this report while the soil-cement portion is presented in Appendix C.

We understand the project will consist of the construction of about 27,000 feet of diversion dike and earthen channel, and approximately 4,000 feet of trapezoidal floodway channel. A portion of the dike will be on Nellis Air Force Base property. The eastern 1/3 of the dike alignment crosses the Air Force Base small arms range. The dike will be about 10 feet in height above the earthen channel bottom with soil cement placed on the upstream face of the slopes. The downstream face of the dike will have 4 to 6 inches of local rock facing for erosion protection. Oversize gravels and cobbles from the channel excavation may be used for the rock facing. The earthen channel will vary between 50 and 150 feet in width and will run along the toe of the dike. A 3:1 (horizontal to vertical) cut slope is planned for the side of the earthen channel opposite the dike. Figure No. 1 presents the typical cross-section of the dike and earthen channel. The floodway channel will have a 300 foot wide earthen bottom while the slopes will be lined with soil cement. The floodway channel will be approximately 3 to 4 feet deep and will transition into a narrower inlet area to the existing North Las Vegas Detention Basin. Soil cement cutoff walls extending below the toe of the dike and floodway channel slopes are also planned. The bend where the floodway and dike meet has a radius of approximately 500 feet. The bend may require rip-rap, gabions, or soil cement reinforcement.

The anticipated maximum (100-year) depth of water against the dike is 5 feet. The flow within the floodway will generally meander through the 300 foot wide channel. The approximate alignment of the dike, earthen channel, and floodway, and location of the inlet area, bend and existing detention basin are presented on Drawing No. 2.

SCOPE OF SERVICES

The following tasks were included in our scope of services:

1. A field exploration program was conducted which consisted of drilling, excavating, logging, and sampling of sixteen (16) exploratory borings and fourteen (14) test pits to depths varying from 2½ to 15 feet. The approximate location of the explorations are shown on Drawing No. 2. A description of the equipment and procedures used during the exploration program is presented in Appendix A. Summaries of the boring and test pit logs are also presented in Appendix A. Samples of the subsurface soils were obtained from the borings and test pits and were taken to our laboratory for further evaluation and testing.
2. Eight (8) bulk samples of the surficial soils on the fan area, both in and out of the washes, were obtained for grain-size distribution tests for sediment transport analysis (by Boyle). The approximate location of the bulk samples are shown on Drawing No. 2. The results of the grain-size distribution tests are presented on Drawings Nos. A-53 through A-60 in Appendix A.
3. Laboratory tests were conducted on selected soil samples. Tests included moisture-density determinations, solubility, chemical analyses, sieve analyses, and direct shear tests. Descriptions and results of the laboratory tests are presented in Appendix A.
4. Laboratory tests were also conducted on selected soil samples for the two soil cement designs. Tests including sieve analyses, Atterberg Limits, and moisture/density relationships were performed on each sample to classify the soil and to establish a range of cement contents for the mix design. Other tests included freeze/thaw, wet/dry, and compressive strength. The freeze/thaw, wet/dry, and compressive strength graphs, gradations, and moisture/density curves for each mix design are enclosed in Appendix C.
5. Results of the field exploration and laboratory testing were evaluated and engineering analyses were performed to develop appropriate recommendations for the design and construction of the proposed project.
6. This geotechnical report and the soil cement mix design report were prepared to present the findings, conclusions and recommendations of this firm.

GEOLOGIC AND SEISMIC CONDITIONS

FAULTING AND SEISMICITY

No bedrock or tectonic faults are known to transect the alluvium deposits in the area of the proposed project. The nearest fault with evidence of possible geologically recent displacement is located at the foot of Frenchman Mountain, approximately 7 miles southeast of the project.

The west end of the project is located approximately 1½ miles east of a topographic lineation regarded as a compaction fault as mapped on the Fault Scarps and Fissures in Las Vegas Valley Map, published by the Nevada Bureau of Mines and Geology, Bulletin 95, John W. Bell, 1981. It is generally agreed that compaction faults are not bedrock faults, although their displacement may have been at least partly induced by a seismic event. The age of these escarpments have been dated by others at about 14,000 years old. No fissures were observed along the proposed alignment.

Las Vegas Valley is located in Seismic Zone 2B as categorized in the Uniform Building Code. Zone 2B represents a low to moderately active seismic area.

ESTIMATED GROUND ACCELERATIONS

A regional map published by Algermissen and Perkins (1976) presents the expected peak horizontal ground acceleration for the Las Vegas Valley as approximately 0.04 g. This value has a 10 percent chance of being exceeded in a 50-year period. Site specific seismicity model analyses have been performed by CCSW on other projects in the Las Vegas Valley. This analyses have typically found the maximum credible peak horizontal ground acceleration to range between 0.2g and 0.3g. For an event having a 10 percent chance of exceedance during a 100-year design life the peak horizontal ground acceleration has ranged between 0.1g and 0.2 g. The peak horizontal ground acceleration recommended for the design of the project is 0.15g.

EXISTING CONDITIONS

SURFACE

At the time of our field investigation, the proposed dike and floodway alignments were undeveloped desert. Some scattered trash, debris and fill piles existed on or near the western half of the dike alignment and some of the floodway alignment. The ground surface within or near the alignments were either disturbed or in a natural state. Several washes crossed the dike alignment. The dike alignment crosses several berms (undocumented fill) that are generally in the shape of a triangle (as seen from an aerial view) that are on the Nellis Air Force Base property.

SUBSURFACE

Based on results of our subsurface explorations, the subsoils generally consisted of 0 to 1 foot of loose granular soils overlying medium dense to dense granular soils and moderately hard to hard cemented soils (caliche). The depths to and thickness of the cemented soils are provided below in Table No. 1. Free groundwater was not encountered to the depths explored for this project.

BR = Backhoe Refusal

Laboratory test results indicate that the on-site soils have moderate dry densities, a moderate to high shear strength, and a low potential for gypsum solubility. The native soils should be considered corrosive to concrete, soil cement and metal.

Based on the results of our subsurface exploration and our experience, variations in the continuity and depth of subsoil deposits should be anticipated. Due to the nature and depositional characteristics of the natural soils along the dike and floodway alignment, care should be exercised in interpolating subsurface soil conditions beyond the exploratory borings and test pits.

GENERAL EVALUATION

Based on the results of the field and laboratory investigations, it is our opinion that the undocumented fills and the surficial loose native soils in their present condition are not considered suitable for the support of the dike. The native medium dense to dense granular soils and the moderately hard to hard cemented soils should provide adequate support after the surface vegetation and organics have been removed. Cemented soils will be difficult to excavate and will require heavy-duty excavation methods for removal.

The on-site soils are suitable for use as materials for soil-cement and dike embankment fill. Based on slope stability analyses, the planned 4:1 and 3:1 slopes for the dike and/or earthen channel cut slope are stable. Depending on the construction methods for the soil-cement, a flatter slope may be required for the upstream face of the dike. A 3:1 slope for the floodway channel should be used.

RECOMMENDATIONS

DIKE

It is our understanding that the proposed dike to be constructed will be about 10 feet in height above the earthen channel bottom.

The native granular soils should provide adequate support for the dike after the surface vegetation and organics have been removed and the foundation preparation has been conducted as presented in the following Earthwork section. The on-site soils are suitable for use as materials for dike embankment fill or other

structural fills. The requirements for structural fill, placement and compaction are presented in the following Earthwork section.

The stability analysis indicates that the dike embankment slopes on both the upstream and downstream faces should not be made steeper than 3:1 (horizontal to vertical). The dike was also analyzed for a minimum crest width of 10 feet. The recommended slopes assume that all of the exposed dike surfaces will be adequately protected from erosional forces. The planned rock facing for the downstream face and soil-cement for the upstream face are suitable for embankment protection. Embankment settlement due to consolidation of fill and foundation materials should be negligible.

The inclination of the dike or channel slopes will depend to a certain extent on the type of erosion protection and method of construction selected. If soil-cement is used on the outer face, it should be a minimum of 12 inches thick (perpendicular to the slope) from a construction standpoint. Soil-cement slope protection is normally placed by one of two methods. Lifts of the soil-cement can be placed parallel to the slope and compacted. This method usually requires a minimum soil-cement lift width equal to the width of the equipment (about 8 feet). The outer face of the slope is normally overbuilt with this method, and trimmed back to the final face. With this method, slopes as steep as 3:1 (horizontal to vertical) could be constructed.

Soil-cement can also be placed and compacted in lifts perpendicular to the slope. With this method, soil-cement thicknesses down to 12 inches could be constructed, but it is normally necessary to flatten slopes, so that placement and compaction equipment can operate up and down the slope. Our past experience has indicated that with conventional placement and compaction equipment, this usually requires slopes of 4:1 (horizontal to vertical) or flatter.

The final thickness of the soil-cement erosion protection layer, should be determined by a qualified hydraulic engineer, after water velocities, and the soil-cement strength and durability characteristics have been determined.

Slope stability analyses were performed on the dike in general accordance with the Nevada State Statutes, Corps of Engineers and the Clark County Regional Flood Control District "Hydrologic Criteria and Drainage Design Manual". The dike was analyzed with the computer program SB-Slope, Version 3.0. It was used to calculate the minimum factor of safety for four separate cases; (1) end of construction, (2) sudden drawdown, (3) steady state seepage, and (4) seismic steady

state seepage. Since the 3:1 cut slope is generally of the same materials as the dike, it was assumed that the factors of safety obtained for the dike were applicable to the 3:1 cut slope. The SB-Slope program utilizes the simplified Bishop Method of slope stability analysis for circular failure surfaces. A layer of soil cement and rock facing erosion protection materials were simulated in the stability analyses as uniform surcharge loads. Based on laboratory tests, an average saturated angle of internal friction of 38 degrees was used. The maximum failure surface was 10 feet below the dike. A summary of the minimum acceptable factors of safety, and calculated factors of safety is presented on the following table. The results of the slope stability analysis are presented and further explained in Appendix B.

Table No. 2: Calculated and Required Factors of Safety for Slope Stability

Loading Condition	Case	Required[1] F.S.	Calculated F.S.
End of Construction	1	1.3	2.4
Sudden Drawdown	2	1.2	2.0
Static-Steady State Seepage	3	1.5	2.3
Seismic-Steady[2] State Seepage	4	1.0	1.2

[1] In accordance with the "Recommended Guidelines for Safety Inspection of Dams" published by the Corps of Engineers (1973).
[2] Seismic evaluation was based on pseudo-static analysis with seismic coefficient of 0.15.

FLOODWAY CHANNEL

It is our understanding that for erosion protection the floodway channel slopes will be covered with either benched gabions, wire basket rip-rap or soil cement. Based on our slope stability analysis, it is recommended that the floodway channel slopes should not be made steeper than 3:1. If soil-cement is used for erosion protection, a flatter slope may be necessary for construction purposes. The floodway channel slopes were also analyzed with the computer program SB-Slope for the same cases as the embankment. The computed factors

of safety were higher than the required minimums. The sudden drawdown case, which was the worst case, is presented in Appendix B. A factor of safety of 1.2 was calculated.

Benched gabions or wire basket rip-rap should be placed on native medium dense to dense granular soils. Gabions should be designed within the guidelines and standards of the manufacturer.

EROSION PROTECTION

Based on the results of our field and laboratory investigations, it is our opinion that the on-site granular soils will be subject to erosion due to high water velocities. Therefore, erosion protection will be required for inlet and bend areas, dike slopes, and along the floodway channel. As previously mentioned, soil-cement will be used for the upstream slope of the dike and possibly the floodway channel side slopes. Soil-cement should be at least 12 inches thick. However, the soil-cement thickness should be designed based on water velocity, and strength and durability of soil-cement.

Erosion protection for the inlet area to the detention basin and for the transition from dike channel to floodway channel (1000 foot radius bend), may consist of dumped rip-rap, wire basket rip-rap or gabions. The rip-rap rock size and section thicknesses should be designed after flow velocities are determined by a hydraulic engineer. If rip-rap or gabions are used, a puncture-resistant synthetic filter cloth may be required to reduce the amount of scour and piping of natural soils during heavy flows. The type of filter cloth will depend on the type of erosion protection used. We are available to provide additional detailed recommendations for erosion protection after a particular method has been selected.

EARTHWORK

Site Preparation: Within the areas to be graded, we recommend that all vegetation, undocumented fill, rubble, trash, debris and any loose or disturbed native soils should be removed from within the proposed dike, floodway and inlet structure areas. Undocumented fill, loose, or disturbed native soils should be excavated, processed, and stockpiled for later use as engineered fill.

Following stripping and clearing in areas to receive structural fill, such as the dike area, we recommend that the exposed native soils be scarified to a depth of at least 9 inches, moisture-conditioned to within 2 percent of the optimum moisture content, and recompacted to a minimum relative compaction of 95 percent (ASTM D1557). Scarification may be terminated on moderately hard to hard cemented soils.

The on-site sands and gravels should be considered to be highly erodible. Care should be taken during construction to minimize potential storm water from eroding the unprotected side slopes of the proposed dike and floodway channel.

Excavation Considerations: The surficial non-cemented soils encountered during our field exploration should be readily excavatable with conventional earthwork equipment. Hard caliche and moderately hard cemented soils were encountered at varying depths below the existing ground surface. Excavation of these cemented materials will require the use of rock excavation techniques such as ripping with a heavy-duty dozer, heavy-duty backhoe, Ho-ram, blasting, headache ball or other methods. The Contractor should be aware of the potential for vibrational damage to adjacent or nearby structures when using heavy impact equipment or blasting during removal of moderately hard to hard cemented materials.

Excavations over 4 feet deep should be laid back to safe slopes. Cut excavation operations should be conducted in accordance with Section Nos. 1926.650 *through* .653 *of the State of* Nevada Occupational Safety and Health Standards for the Construction Industry as currently amended. Safety of construction personnel is the responsibility of the Contractor.

Dike Fill: Prior to the placement of compacted fill for the dike, the native soils should be scarified and recompacted as recommended in the prior subsection, Site Preparation. Fill materials may consist of approved imported granular soils or on-site sands and gravels that are cleaned of organics and cobbles larger than 6 inches. The on-site soils will be suitable for embankment construction. Unless additional stability analysis is conducted, imported fill materials should consist of well or poorly graded sand or gravel with the following characteristics:

a. be free of organics and inert materials larger than 6 inches,
b. have 80 to 100 percent passing the 3-inch sieve,
c. have 10 to 70 percent passing the No. 4 sieve,
d. have less than 25 percent passing the No. 200 sieve,
e. have a saturated and drained shear strength internal friction angle of 38 degrees or greater,
f. be non-expansive,
g. have a gypsum solubility of 1 percent or less, and
h. have water soluble sodium sulfate percentage less than 0.2.

All imported fill should be evaluated and/or tested by a representative of this office for conformance with these recommendations.

Structural fill should be placed in controlled layers compatible with the type of compaction equipment used but not exceed 12 inches loose. The fill should be moisture conditioned to obtain soil moisture within 2 percent of optimum. Each layer of fill should be compacted to at least 95 percent of the maximum laboratory dry density (as determined by ASTM D-1557). The compaction requirements for fill slopes should extend out to the slope face. The best method for compacting the slope face is to overfill and then cut back to the properly compacted material.

Where fill is placed on a natural slope steeper than 5:1 (horizontal to vertical), and a height greater than 5 feet, the fill should be benched into competent materials. The height of the benches should not exceed 3 feet.

Material Volume Changes: There will be shrinkage when excavating and compacting the on-site soils. An estimated shrinkage factor of 10 to 20 percent is applicable for non-cemented native soils. A subsidence factor of 0.1 feet should be used in all areas where the exposed native soils are compacted to a depth of 6 inches. An estimated swell factor of 0 to 10 percent is applicable for the natural cemented soils.

SOIL CORROSIVITY

The on-site soils should be considered corrosive to buried metal and have sulfate levels above that considered harmful to normal strength concrete and soil cement.

1. Consideration should be given to corrosion protection systems for buried metal such as cathodic protection or the use of PVC where permitted by local building codes.
2. All concrete and soil cement in contact with the on-site soils should contain Type V cement.
3. The concrete should be placed with a maximum 4-inch slump and good densification procedures should be used during placement to prevent honeycombing.

PROJECT REVIEW AND CONSTRUCTION OBSERVATION

This report has been prepared to aid in the evaluation of this alignment and to assist in the design of this project. This office should be provided the opportunity to review the final design drawings and specifications in order to determine whether the assumptions and recommendations presented in this report are valid and have been implemented. Review of the final design drawings and specifications should be noted in writing and become a supplement to this report.

Variations in soil conditions may be encountered during construction of this project. In order to permit correlation between the field conditions encountered in this investigation and the actual conditions encountered during construction, and to confirm recommendations presented herein, this office should be retained to perform sufficient review during construction of this project. Observation and testing should be performed during construction to confirm that the recommended foundation preparations are performed, that suitable dike fill soils are placed properly on prepared native soils, and that fills are properly placed and compacted.

CLOSURE

The recommendations given in this report are based on results of field and laboratory investigations, combined with interpolation of subsurface conditions between boring and trench locations. The nature and extent of variations between

the explorations may not become evident until construction. If variations are exposed during construction, this office should be notified so the variations can be reviewed and the recommendations of this report modified or verified in writing.

If changes in the nature, design, or location of the facility are planned, the recommendations contained in this report shall not be considered valid unless the changes are reviewed and the recommendations of this report modified or verified in writing.

This report has been prepared only to aid in the evaluation of this site and to provide geotechnical recommendations for the design of this project. Any person using this report for bidding or construction purposes should be aware of the limitations of this report as mentioned above and should conduct an independent investigation as he deems necessary to satisfy himself as to the surface and subsurface conditions to be encountered, and the procedures to be used in the performance of work on this project.

It has been our pleasure to serve you on this project. If you have any questions, please contact this office.

Respectfully submitted,

CONVERSE CONSULTANTS SOUTHWEST, INC.

APPENDIX A

FIELD AND LABORATORY INVESTIGATIONS

FIELD INVESTIGATION

The subsurface soil conditions were explored by drilling sixteen (16) borings and excavating fourteen (14) test pits to depths varying from 2½ to 15 feet. In addition, eight (8) bulk samples of the surficial soils in and out of the wash were obtained for laboratory testing. The approximate locations of the explorations are shown on Drawing No. 2. Continuous logs of the subsurface conditions as encountered in the explorations were recorded at the time of drilling or excavation by a field engineer. The subsurface conditions encountered were visually classified in accordance with ASTM D2487-85, which is based on the Unified Soil Classification System. Summaries of the subsurface conditions encountered are presented on the boring and trench summary sheets, Drawing Nos. A-1 through A-30. A key to soil symbols and terms is found on Drawing No. A-31. The soil classification system for engineering purposes is further explained on Drawing No. A-32.

Drilling was accomplished with a truck-mounted rotary air drill rig and a hollow stem auger rig equipped for soil sampling. Relatively undisturbed soil samples were obtained using a 2.5-inch inside diameter Converse sampler driven with a 340-pound or 140-pound hammer free-falling through a distance of 30 inches. Sampler driving resistance, expressed as blows per foot of penetration, is presented on the boring logs at the respective sampling depths. The test pits were excavated with a Case 580E rubber-tired backhoe.

LABORATORY INVESTIGATION

Laboratory tests were conducted on representative soil samples for the purpose of classification, and determination of their physical properties and engineering characteristics. The amount and selection of the types of testing for a given study are based on the geotechnical conditions of the project. A summary of the various laboratory tests conducted by our office for engineering purposes is presented below.

The soil samples presently stored in our laboratory will be discarded 30 days after the date of this report, unless this office receives a specific request to retain the samples for a longer period.

MOISTURE CONTENT AND DRY DENSITY: Data obtained from these tests, performed on relatively undisturbed samples obtained from the field, were used in the classification and correlation of the soils and to provide qualitative information regarding soils strength and compressibility. Test results are presented on the summary boring logs, Drawing Nos. A-1 through A-30.

CHEMICAL ANALYSES: Chemical tests were performed on representative soil samples to investigate the potential for chemical heave and for soil corrosion of concrete. The chemical analyses for water soluble sulfates and sodium were performed by Atlas Chemical Testing Laboratories, Inc. in Las Vegas, Nevada. The results of the chemical tests are presented in the table below:

Exploration Location	Depth (feet)	Soil Description	Percent Sodium	Percent Sulfate	Total Available Water Soluble Sodium Sulfate%
B-2	0-14½	PRLY GRADED GRAVEL	<0.01	0.01	<0.01
T-9	0-4	PRLY GRADED GRAVEL	<0.01	<0.01	<0.01
B-13	0-15	PRLY GRADED GRAVEL	0.01	<0.01	<0.01
T-27	0-8	PRLY GRADED GRAVEL	0.08	0.55	0.24

DIRECT SHEAR STRENGTH: Progressive direct shear tests were performed on selected undisturbed and remolded samples using a constant strain rate direct shear machine. The remolded samples were compacted to 90 percent of the maximum dry density within 2 percent of optimum moisture content. The samples were placed in the shear machine, a specified normal load was applied, and the specimen was saturated then sheared until a maximum shear strength was developed. After the soil specimen had developed maximum shear resistance under the first normal load, the normal load was removed and the specimen was pushed back to its original undeformed configuration. Another normal load was then applied, and the specimen was sheared a second time. This process was repeated for several different normal loads. Results of the direct shear tests are presented in the following table:

Exploration Location	Depth (feet)	Soil Description	Angle of Internal Friction, (°)	Coulomb Cohesion (psf)
*B-1	3-4	POORLY GRADED GRAVEL	45	300
*B-1	13-14	POORLY GRADED GRAVEL	45	0
B-1	0-14½	POORLY GRADED GRAVEL	35	250
*B-2	8-9	POORLY GRADED GRAVEL	44	200
*B-3	3-4	POORLY GRADED GRAVEL	49	100
*B-3	8-9	SILTY GRAVEL	41	100
B-7	0-14½	SILTY GRAVEL	39	100
B-14	0-14½	POORLY GRADED GRAVEL	40	50
T-21A	0-5½	POORLY GRADED GRAVEL	36	100
T-23	0-8½	POORLY GRADED GRAVEL	42	0
T-27	0-8	POORLY GRADED GRAVEL	38	0

*Undisturbed sample

SOLUBILITY: *Solubility tests were performed to determine the amount of* water-soluble materials (principally gypsum) present in the soil. After drying the samples in a 60-degree centigrade oven, about 2.0 liters of tap water was passed through each sample. The samples were then oven-dried and the amount of soluble materials lost was calculated. The results of the solubility tests are presented in the following table:

Exploration Location	Sample Depth (feet)	Soil Description	Solubility, (percent by dry weight)
B-2	0-14½	POORLY GRADED GRAVEL	0.4
B-13	0-15	POORLY GRADED GRAVEL	1.1
T-25	0-10	POORLY GRADED GRAVEL	1.6

KEY TO SOILS SYMBOLS AND TERMS

TERMS USED IN THIS REPORT FOR DESCRIBING SOILS ACCORDING TO THEIR TEXTURE OR GRAIN SIZE DISTRIBUTIONS ARE GENERALLY IN ACCORDANCE WITH THE UNIFIED SOILS CLASSIFICATION SYSTEM.

TERMS DESCRIBING CONDITION, CONSISTENCY AND HARDNESS

COARSE GRAINED SOILS (major portion retained on No. 200 sieve): includes (1) clean gravels, (2) silty or clayey gravels and (3) silty, clayey or gravelly sands. Consistency is rated according to relative density, as determined by laboratory tests.

Descriptive Term	Relative Density
Very loose	0 to 15%
Loose	15 to 40%
Medium Dense	40 to 70%
Dense	70 to 85%
Very Dense	85 to 100%

FINE GRAINED SOILS (major portion passing No. 200 sieve): Includes (1) inorganic and organic silts and clays, (2) gravelly, sandy or silty clays, and (3) clayey silts. Consistency is rated according to shearing strength as indicated by penetrometer readings or by direct shear tests.

Description Term	Shear Strength (ksf)
Very soft	less than 0.25
Soft	0.25 to 0.50
Firm	0.50 to 1.00
Stiff	1.00 to 2.00
Very stiff	2.00 to 4.00
Hard	4.00 and higher

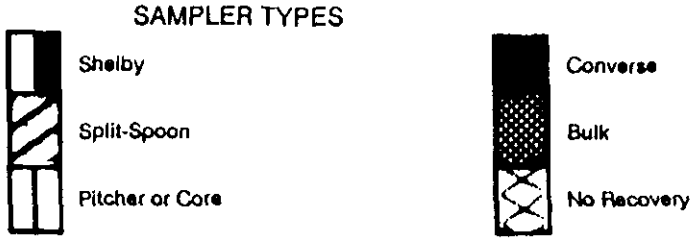
ROCK: Includes gravels, cobbles, rock, caliche and bedrock materials. Hardness is related to field identification procedures described below.

Descriptive Term	Field Identification Test
Soft	Can be dug by hand and crushed by fingers
Moderately hard	*Friable, can be gouged deeply with knife and will crumble readily under light hammer blows.*
Hard	Knife scratch leaves dust trace, will withstand a few hammer blows before breaking.
Very Hard	Scratched with knife with difficulty, difficult to break with hammer blows.

LEGEND OF LABORATORY TESTS

G-Grain	S-Swell	DS-Direct Shear
A-Liquid & Plastic Limits	Ch-Chemical	T-Triaxial
PP-Pocket Penetrometer	N-Chemical Heave	Sol-Solubility
U-Unconfined	C-Consolidation	P-Compaction

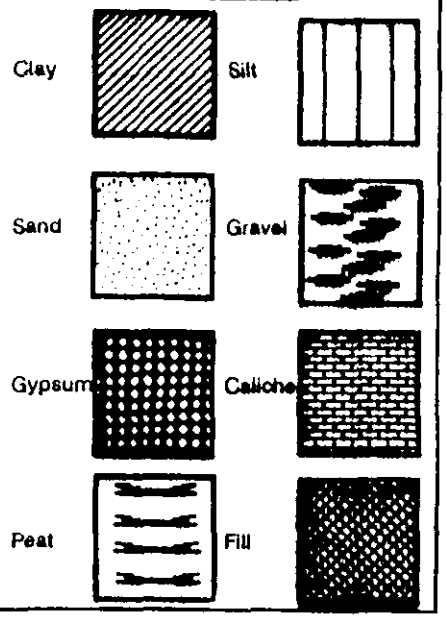
SAMPLER TYPES



SIZE PROPORTIONS

Designation	Percent by Weight
Trace	0 to 5
Few	5 to 10
Little	15 to 25
Some	30 to 45

SOIL TYPE KEY

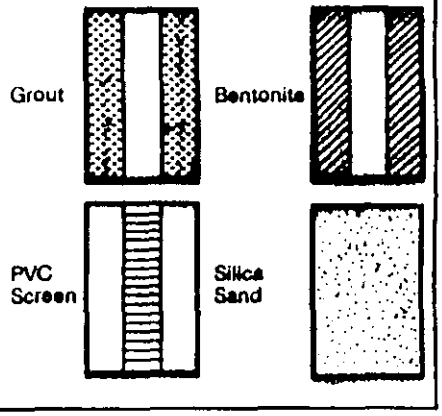


SOIL MOISTURE

From low to high the soil moisture is indicated by:

Dry
Slightly moist
Moist
Very moist
Wet

WELL DESIGN KEY



Converse Consultants Southwest, Inc. Drawing No. A-31

CLASSIFICATION OF SOILS FOR ENGINEERING PURPOSES

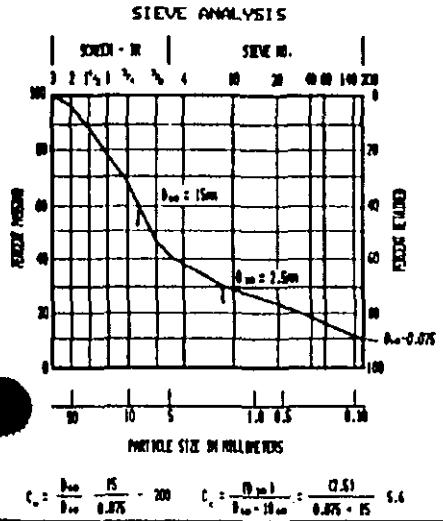
ASTM Designation: D 2487 - 85
(Based on Unified Soil Classification System)

Criteria for Assigned Group Symbols and Groups Names Using Laboratory Tests[A]				Soil Classification	
				Group Symbol	Name[B]
Coarse-Grained Soils More than 50% retained on No. 200 sieve	Gravels More than 50% coarse fraction retained on No. 4 sieve	Clean Gravels Less than 5% fines[C]	$C_u \geq 4$ and $1 \geq C_c \geq 3$[E]	GW	Well graded gravel[F]
			$C_u < 4$ and/or $1 > C_c > 3$[E]	GP	*Poorly graded gravel*[F]
		Gravels with Fines More than 12% fines[C]	Fines classify as ML or MH	GM	Silty gravel[F G H]
			Fines classify as CL or CH	GC	Clayey gravel[F G H]
	Sands 50% or more of coarse fraction passes No. 4 sieve	Clean Sands Less than 5% fines[D]	$C_u \geq 6$ and $1 \geq C_c \geq 3$[E]	SW	Well-graded sand[I]
			$C_u < 6$ and/or $1 > C_c > 3$[E]	SP	Poorly graded sand[I]
		Sands with Fines More than 12% fines[D]	Fines classify as ML of MH	SM	Silty sand[G H I]
			Fines classify as CL of CH	SC	Clayey sand[G H I]
Fine-Grained Soils 50% or more passes the No. 200 sieve	Silts and Clays Liquid limits less than 50	Inorganic	PI > 7 and plots on or above "A" line[J]	CL	Lean clay[K L M]
			PI < 4 or plots below "A" line[J]	ML	*Silt*[K L M]
		organic	$\frac{\text{Liquid limit - oven dried}}{\text{Liquid limit - not dried}} < .75$	OL	Organic clay[K L M N] Organic silt[K L M O]
	Silts and Clays Liquid limit 50 or more	Inorganic	PI plots on or above "A" line	CH	Fat clay[K L M]
			PI plots below "A" line	MH	Elastic silt[K L M]
		organic	$\frac{\text{Liquid limit - oven dried}}{\text{Liquid limit - not dried}} < .75$	OH	*Organic clay*[K L M P] Organic silt[K L M O]
Highly organic soils	Primarily organic matter, dark in color, and organic odor			PT	Peat

[A] Based on the material passing the 3-in. (75-mm) sieve.
[B] If field sample contained cobbles or boulders, or both, add 'with cobbles or boulders, or both' to group name.
Gravels with 5 to 12% fines require dual symbols:
GW-GM well-graded gravel with silt
GW-GC well-graded gravel with clay
GP-GM poorly graded gravel with silt
GP-GC poorly graded gravel with clay
[D] Sands with 5 to 12% fines require dual symbols:
SW-SM well-graded sand with silt
SW-SC well-graded sand with clay
SP-SM poorly graded sand with silt
SP-SC poorly graded sand with clay

$$^{E}Cu = D_{60}/D_{10} \quad Cc = \frac{(D_{30})^2}{D_{10} \times D_{60}}$$

[C] If soil contains ≥ 15% sand, add 'with sand' to group names.
[G] If fines classify as CL-ML, use dual symbol GC-GM, or SC-SM.
[H] If fines are organic, add 'with organic fines' to group name.
[I] If soil contains ≥ 15% gravel, add 'with gravel' to group name.
[J] If Atterberg limits plot in hatched area, soils is a CL-ML, silty clay.
[K] If soil contains 15 to 29% plus No.200, add 'with sand' or 'with gravel', whichever is predominant.
[L] If soil contains ≥ 30% plus No. 200, predominantly sand, add 'sandy' to group name.
[M] If soil contains ≥ 30% plus No. 200, predominantly gravel, add 'gravelly' to group name.
[N] PI ≥ 4 and plots on or above 'A' line.
[O] PI < 4 or plots below 'A' line.
[P] PI plots on or above 'A' line.
[Q] PI plots below 'A' line.



$$C_u = \frac{D_{60}}{D_{10}} = \frac{15}{0.075} = 200 \qquad C_c = \frac{(D_{30})^2}{D_{60} \times D_{10}} = \frac{(0.5)^2}{0.075 \times 15} = 0.2$$

APPENDIX B

SLOPE STABILITY ANALYSIS

Based on the results of the geologic/seismic evaluation and the field and laboratory investigations, slope stability analyses of the proposed dike embankment were performed. The stability analyses were conducted in general accordance with the Nevada State Statutes, the Clark County Regional Flood Control District "Hydrologic Criteria and Drainage Design Manual". The anticipated maximum dike and floodway channel slope sections were analyzed for four separate cases; (1) end of construction, (2) sudden drawdown, (3) steady state seepage and (4) seismic. The dike was analyzed for a height of 10 to 11 feet with 5 feet of water. The floodway channel side slopes were analyzed for a height of 4 feet with 3 feet of water. The computer program SB-Slope, Version 3.0, developed by Von Gunten Engineering Software, Inc. was used to calculate the minimum factor of safety for each of the 4 cases for the dike. The factor of safety for sudden drawdown was calculated for the floodway channel side slopes (worst case) only. The SB-Slope program utilizes the simplified Bishop Method of slope stability analysis for circular failure surfaces. A 12-inch layer of soil cement and a 6-inch thick layer of rock material was simulated in the stability analyses as uniform surcharge loads of 145 and 65 pounds per square foot (psf) on the dike toe slope and back slope, respectively. The computer printouts showing the results of the stability analyses for the maximum anticipated embankment and floodway channel sections are also presented in this Appendix.

Subject: Soil Cement Mix Designs
Range Wash Flood Control Project
Near Range Road
North Las Vegas, Nevada

Gentlemen:

We are pleased to submit the results of our Soil Cement Mix Designs conducted for the construction of the Range Wash Flood Control Project in North Las Vegas, Nevada. The mix designs were performed in accordance with our proposal of July 29, 1991.

FIELD INVESTIGATION

On September 13, 1991, a representative of Converse Consultants Southwest, Inc. (CCSW) sampled Trenches 6 and 19 at the locations shown on Drawing No. 2 in the body of this report. The samples were a composite of material from the surface down to 6 feet.

LABORATORY INVESTIGATION

Gradations, Atterberg Limits, and Moisture/Density Relationships were performed on each sample to classify the soil and to establish a range of cement contents for the mix design. Both samples were classified as poorly graded silty gravel with sand. The engineering properties of the samples were found to be similar, the difference being 7 percent more gravel in Trench 6 than in the sample from Trench 19. CCSW used the soil cement mix design procedures from the PCA Soil Cement Laboratory Handbook and the procedures for soil cement from ASTM D558, D559, and D560. The freeze/thaw, wet/dry, and compressive strength graphs, gradations, and moisture/density curves for each mix design are enclosed with this report.

ENGINEERING ANALYSIS

The PCA Soil Cement Manual recommends a maximum allowable volume loss of 14 percent on the wet/dry and freeze/thaw samples for this type of soil (AASHTO Classification A-1-a). This criteria was used to determine the percent of cement to be used for the soil cement.

CCSW has evaluated the test data for both test areas. Five percent cement content is the critical point of the wet/dry and freeze/thaw curves for both mix designs. The data indicates that a 5 percent cement content will provide a soil cement mixture with sufficient resistance to weathering as well as a factor of safety to guard against minor deviations during construction, mixing, and batching the soil cement. For construction control, the compressive strength for both mix designs should be a minimum of 550 psi at 7 days.

PCA procedures are for resistance to weathering of a base course material covered by a surfacing course. Some weathering of the top surface should be anticipated if the material is not covered by a surfacing course.

If design criteria other than weather resistance is to be considered, such as compressive strength, the enclosed compressive strength curves may be used. In selecting a cement content based upon compressive strength, we recommend a factor of safety of 0.5 percent cement be used.

SOIL CEMENT MIXTURE

Soil Cement shall be produced and constructed in accordance with the requirements listed below and Section 304 of the Uniform Standard Specifications for Public Works Construction Off-Site Improvements, Clark County Area, Nevada, 1986 Edition. The plant-mix method of batching and mixing shall be used.

Minimum Compaction: 95% of ASTM D 558 maximum density
Minimum 7 Day Compressive Strength: 550 psi
Soil Source: Screened Native Gravels, AASHTO Classification A-1-a
Cement Type: V
Cement Content: 5% by weight of dry soil
Soil Properties:
Plastic Index: 6 maximum
Gradation:

Screen or Sieve Size	Percent Passing
3"	100
2"	90-100
No. 4	35-65
No. 10	20-50
No. 40	10-30
No. 200	4-15

If you have any questions regarding these mix designs or if we may be of further assistance, please don't hesitate to call.

Respectfully submitted,

CONVERSE CONSULTANTS SOUTHWEST, INC.

Rippability Study Observations
Range Wash Flood Control Project
North Las Vegas, Nevada

Gentlemen:

INTRODUCTION

This report presents the results of our rippability study observations conducted for the construction of the Range Wash Flood Control Project located near Range Road in North Las Vegas, Nevada. This study was performed in general accordance with our signed Addendum No. 3 to the Standard Form of Agreement With Consultant for Professional Service dated July 26, 1991. Geotechnical recommendations relative to this project were provided in our Geotechnical Investigation report, dated January 8, 1992 (CCSW Project No. 91-33298-01). The findings and conclusions of this study supplement those provided in the previous report.

SCOPE OF WORK

1. A field exploration program was conducted which consisted of trenching/ripping ten (10) locations along the alignment to depths generally ranging from 10 to 10½ feet. The depth of the tenth exploration at the northeastern end of the project was 6½ feet. The trenching/ripping locations were determined by Boyle Engineering personnel. The subsurface conditions, difficulty of ripping, and the size and characteristics of the ripped material as encountered in the explorations were observed at the time of excavation by a field engineer. The trenching/ripping was conducted utilizing a Caterpillar D10N bulldozer equipped with one ripping tooth.

Converse Consultants Southwest, Inc.
4670 South Polaris Avenue
Las Vegas, Nevada 89103-5615
Telephone (702) 795-2121
Facsimile (702) 798-0098

2. Results of the field exploration program were evaluated and this report was prepared to present the findings, conclusions and recommendations of this firm.

FIELD INVESTIGATION

The approximate bulldozer exploration locations relative to the borings and test pits from the previous investigation are presented in the following table:

Bulldozer Exploration Location	Boring or Test Pit Location*
1	Near B-5 south of Range Road
2	Near B-5 north of Range Road
3	T-9
4	B-12
5	B-16
6	Between T-19 and T-20
7	T-22
8	T-25
9	T-27
10	Between T-28 and T-29

*Refer to CCSW report dated January 8, 1992, Drawing No. 2 for boring and test pit locations.

OBSERVATIONS

The subsoils encountered in the explorations generally consisted of 0 to 1 foot of loose sands and gravels overlying medium dense to very dense sands and gravels and slightly to partially cemented (moderately hard) soils. The hardest soils were encountered near the bottom of the explorations. The cemented soils encountered during our previous investigation were generally classified as moderately hard (partially cemented). Based on our observations during this investigation, the bulldozer started ripping at depths ranging from 3 to 4 feet to loosen the soils for dozing. The moderately hard partially cemented soils were generally rippable to the depths explored for this study. The bulldozer did encounter some minor difficulties near the bottom of some of the explorations while ripping.

Generally all of the material excavated from the explorations would be usable for the project. Minor amounts of large cobbles and small boulders were encountered in the explorations. Some of the ripped material near the bottom of some of the explorations ranged in size from 6 to 24 inches. These "chunks" were slightly to partially cemented and were easily broken up by hitting them with a hammer or by dropping.

CONCLUSIONS

The on-site soils along the alignment of the dike and floodway channel, at the locations evaluated, are excavatable and/or rippable to about 10 feet below the existing ground surface with a Caterpillar D10N bulldozer and a single tooth ripper. The cemented soils are slightly to partially cemented. The resulting materials from ripping operations appeared to break down into manageable sized particles. Some minor processing of oversize materials such as cobbles, small boulders and ripped material should be anticipated.

CLOSURE

The observations, opinions, recommendations and conclusions given in this report are: (1) based upon our interpretation of the findings of the field exploration program, (2) based on our geotechnical experience in the locale, (3) subject to confirmation of the conditions encountered during construction, and (4) prepared in accordance with generally accepted professional geotechnical engineering principles and practice. We make no other warranty, either express or implied.

It has been our pleasure to be of continued service to you on this project. If you have any questions, please contact this office.

Additional Slope Stability Analysis
Range Wash Flood Control Project
North Las Vegas, Nevada

Gentlemen:

INTRODUCTION

This report presents the results of our slope stability analysis conducted for the new profile of the Range Wash Flood Control Project located near Range Road in North Las Vegas, Nevada. This study was performed in general accordance with our signed confirmation letter dated February 3, 1992. Geotechnical recommendations relative to this project were provided in our Geotechnical Investigation report, dated January 8, 1992 (CCSW Project No. 91-33298-01). The findings and conclusions of this study supplement those provided in the previous report.

We understand that the dike will be 15.2 feet in height above the earthern channel bottom, and that the soil-cement facing on the upstream face of the dike may not be used. A 3:1 (horizontal to vertical) slope is planned for the downstream slope, and a 4:1 (horizontal to vertical) for the upstream face of the dike. We also understand that the crest width of the dike is 12 feet, and the water depth within the channel is on the order of 10 feet.

SLOPE STABILITY ANALYSIS

The stability analyses were conducted in general accordance with the Nevada State Statutes, the Clark County Regional Flood Control District "Hydrologic Criteria and Drainage Design Manual." The anticipated maximum dike slope sections were analyzed for four separate cases; (1) end of construction, (2) sudden drawdown, (3) steady state seepage, and (4) seismic analysis under steady state seepage. The dike was analyzed for a height of 15.2 feet with 10 feet of impounded water. The computer program SB-Slope, Version 3.0, developed by von Gunten Engineering Software, Inc. was used to calculate the minimum factor of safety by Bishop's simplified method of slices for circular failure surfaces. Based on

previously performed laboratory tests, an average saturated angle of internal friction of 38 degrees, and a cohesion intercept of zero, were used, for both the foundation soil and the compacted embankment. A summary of the minimum acceptable factors of safety, and calculated factors of safety is presented in the following table. The results of the slope stability analyses are presented in Appendix A.

Calculated and Required Factors of Safety for Slope Stability

Loading Condition	Case	Required[1] F.S.	Calculated F.S.
End of Construction	1	1.3	2.5
Sudden Drawdown	2	1.2	1.8
Static-Steady State Seepage	3	1.5	1.7
Seismic-Steady[2] State Seepage	4	1.0	1.4

[1] In accordance with the "Recommended Guidelines for Safety Inspection of Dams" published by the Corps of Engineers (1973).
[2] Seismic evaluation was based on pseudo-static analysis with seismic coefficient of 0.05.

IMPORTANT INFORMATION
ABOUT YOUR
GEOTECHNICAL ENGINEERING REPORT

More construction problems are caused by site subsurface conditions than any other factor. As troublesome as subsurface problems can be, their frequency and extent have been lessened considerably in recent years, due in large measure to programs and publications of ASFE/ The Association of Engineering Firms Practicing in the Geosciences.

The following suggestions and observations are offered to help you reduce the geotechnical-related delays, cost-overruns and other costly headaches that can occur during a construction project.

A GEOTECHNICAL ENGINEERING REPORT IS BASED ON A UNIQUE SET OF PROJECT-SPECIFIC FACTORS

A geotechnical engineering report is based on a subsurface exploration plan designed to incorporate a unique set of project-specific factors. These typically include: the general nature of the structure involved, its size and configuration; the location of the structure on the site and its orientation; physical concomitants such as access roads, parking lots, and underground utilities; and the level of additional risk which the client assumed by virtue of limitations imposed upon the exploratory program. To help avoid costly problems, consult the geotechnical engineer to determine how any factors which change subsequent to the date of the report may affect its recommendations.

Unless your consulting geotechnical engineer indicates otherwise, *your geotechnical engineering report should not be used:*

- When the nature of the proposed structure is changed, for example, if an office building will be erected instead of a parking garage, or if a refrigerated warehouse will be built instead of an unrefrigerated one;
- when the size or configuration of the proposed structure is altered;
- when the location or orientation of the proposed structure is modified;
- when there is a change of ownership, or
- for application to an adjacent site.

Geotechnical engineers cannot accept responsibility for problems which may develop if they are not consulted after factors considered in their report's development have changed.

MOST GEOTECHNICAL "FINDINGS" ARE PROFESSIONAL ESTIMATES

Site exploration identifies actual subsurface conditions only at those points where samples are taken, when they are taken. Data derived through sampling and subsequent laboratory testing are extrapolated by geotechnical engineers who then render an opinion about overall subsurface conditions, their likely reaction to proposed construction activity, and appropriate foundation design. Even under optimal circumstances actual conditions may differ from those inferred to exist, because no geotechnical engineer, no matter how qualified, and no subsurface exploration program, no matter how comprehensive, can reveal what is hidden by earth, rock and time. The actual interface between materials may be far more gradual or abrupt than a report indicates. Actual conditions in areas not sampled may differ from predictions. *Nothing can be done to prevent the unanticipated, but steps can be taken to help minimize their impact.* For this reason, *most experienced owners retain their geotechnical consultants through the construction stage*, to identify variances, conduct additional tests which may be needed, and to recommend solutions to problems encountered on site.

SUBSURFACE CONDITIONS CAN CHANGE

Subsurface conditions may be modified by constantly-changing natural forces. Because a geotechnical engineering report is based on conditions which existed at the time of subsurface exploration, *construction decisions should not be based on a geotechnical engineering report whose adequacy may have been affected by time.* Speak with the geotechnical consultant to learn if additional tests are advisable before construction starts.

Construction operations at or adjacent to the site and natural events such as floods, earthquakes or groundwater fluctuations may also affect subsurface conditions and, thus, the continuing adequacy of a geotechnical report. The geotechnical engineer should be kept apprised of any such events, and should be consulted to determine if additional tests are necessary.

GEOTECHNICAL SERVICES ARE PERFORMED FOR SPECIFIC PURPOSES AND PERSONS

Geotechnical engineers' reports are prepared to meet the specific needs of specific individuals. A report prepared for a consulting civil engineer may not be adequate for a construction contractor, or even some other consulting civil engineer. Unless indicated otherwise, this report was prepared expressly for the client involved and expressly for purposes indicated by the client. Use by any other persons for any purpose, or by the client for a different purpose, may result in problems. *No individual other than the client should apply this report for its intended purpose without first conferring with the geotechnical engineer. No person should apply this report for any purpose other than that originally contemplated without first conferring with the geotechnical engineer.*

A GEOTECHNICAL ENGINEERING REPORT IS SUBJECT TO MISINTERPRETATION

Costly problems can occur when other design professionals develop their plans based on misinterpretations of a geotechnical engineering report. To help avoid these problems, the geotechnical engineer should be retained to work with other appropriate design professionals to explain relevant geotechnical findings and to review the adequacy of their plans and specifications relative to geotechnical issues.

BORING LOGS SHOULD NOT BE SEPARATED FROM THE ENGINEERING REPORT

Final boring logs are developed by geotechnical engineers based upon their interpretation of field logs (assembled by site personnel) and laboratory evaluation of field samples. Only final boring logs customarily are included in geotechnical engineering reports. *These logs should not under any circumstances be redrawn* for inclusion in architectural or other design drawings, because drafters may commit errors or omissions in the transfer process. Although photographic reproduction eliminates this problem, it does nothing to minimize the possibility of contractors misinterpreting the logs during bid preparation. When this occurs, delays, disputes and unanticipated costs are the all-too-frequent result.

To minimize the likelihood of boring log misinterpretation, *give contractors ready access to the complete geotechnical engineering report* prepared or authorized for their use. Those who do not provide such access may proceed under the mistaken impression that simply disclaiming responsibility for the accuracy of subsurface information always insulates them from attendant liability. Providing the best available information to contractors helps prevent costly construction problems and the adversarial attitudes which aggravate them to disproportionate scale.

READ RESPONSIBILITY CLAUSES CLOSELY

Because geotechnical engineering is based extensively on judgment and opinion, it is far less exact than other design disciplines. This situation has resulted in wholly unwarranted claims being lodged against geotechnical consultants. To help prevent this problem, geotechnical engineers have developed model clauses for use in written transmittals. These are *not* exculpatory clauses designed to foist geotechnical engineers' liabilities onto someone else. Rather, they are definitive clauses which identify where geotechnical engineers' responsibilities begin and end. Their use helps all parties involved recognize their individual responsibilities and take appropriate action. Some of these definitive clauses are likely to appear in your geotechnical engineering report, and you are encouraged to read them closely. Your geotechnical engineer will be pleased to give full and frank answers to your questions.

OTHER STEPS YOU CAN TAKE TO REDUCE RISK

Your consulting geotechnical engineer will be pleased to discuss other techniques which can be employed to mitigate risk. In addition, ASFE has developed a variety of materials which may be beneficial. Contact ASFE for a complimentary copy of its publications directory.

AGENDA ITEM

SUBJECT:

MAINTENANCE WORK PROGRAM -
FY 1995/96 BUDGET, PLAN, AND INTERLOCAL CONTRACTS

PETITIONER:

GALE WM. FRASER, II, P.E., GENERAL MANAGER/CHIEF ENGINEER

RECOMMENDATION OF PETITIONER:

THAT THE BOARD APPROVE THE BUDGET, PLAN, AND INTERLOCAL CONTRACTS FOR THE FISCAL YEAR 1995/96 ANNUAL MAINTENANCE WORK PROGRAM AND AUTHORIZE THE CHAIRMAN TO SIGN

FISCAL IMPACT:

$1,897,774 (Fund 286)

BACKGROUND:

Staff requested each of the entities to prepare their Fiscal Year 1995/96 Maintenance Work Program plan and budget, and submit the Interlocals for approval by the Board. The Interlocal Contracts, along with an itemized listing of the facilities identified in each work plan, are attached for your review and approval. The following provides a comparison of the current year's budget and last year's expeditures to the requested budgets:

	FY 93/94 Expended	FY 94/95 Budget	FY 95/96 Request	Percent Change	FY 95/96 Initial Request
Boulder City	$ 145,617	$ 90,200	$ 87,200	-3%	$ 25,000
Clark County	902,432	1,283,000	1,301,700	1%	1,301,700
Henderson	116,978	186,229	168,299	-10%	168,299
Las Vegas	89,130	881,500	896,500	2%	225,000
Mesquite	14,522	44,760	44,760	0%	44,760
North Las Vegas	70,700	104,030	133,015	28%	133,015
	$1,339,379	$2,589,719	$2,631,474	0%	$1,897,774

TAC AGENDA	RFCD AGENDA
ITEM #5	ITEM #04
Date: 05/25/95	Date:06/08/95
	ITEM #6
	07/13/95

Upon approval, the Interlocal Contracts will become effective July 1, 1995, and expire June 30, 1996. Requested funding amounts will be available July 1, 1995. The remaining unencumbered fund balances for each entity at the end of FY 1994/95 will be returned to the District's operating fund for subsequent reallocation. Staff has requested that any incompleted scope of work be included within the new fiscal year programs.

Respectfully submitted,

Gale Wm. Fraser, II, P.E.
General Manager/Chief Engineer

AGENDA ITEM DEVELOPMENT

Staff Discussion: **Date:** 07/03/95

MAINTENANCE WORK PROGRAM -
FY 1995/96 BUDGET, PLAN, AND INTERLOCAL CONTRACTS

In accordance with the Operations and Maintenance Manual, the entities have prepared Interlocal Contracts to request funding for maintenance of flood control facilities. The related work plans and budgets for FY 95/96 are included with the Interlocal Contracts.

As in FY 94/95, staff requested that the entities consider the "authorization to proceed" method of funding their next fiscal year maintenance budgets. The Cities of Boulder City and Las Vegas opted to request funding using this alternative method, whereby their full budget is approved; however, funding is made available on an as-needed basis via Board approved Authorizations to Proceed. The remaining entities' budgets are available in full on July 1, 1995.

This request totals $2,631,474. The Project Priority and Estimated Funding Schedule, which includes FY 95/96 Maintenance Work Program requested funding, is included in the backup for review. The District Attorney has reviewed the contracts as to form.

Staff Recommendation:

Approve and authorize the Chairman to sign the FY 1995/96 Maintenance Work Program interlocal contracts.

Discussion by Technical Advisory Committee: **AGENDA #5 Date: 05/25/95**

Recommendation:

Approve.

Discussion by Citizens Advisory Committee: **AGENDA #5 Date: 05/30/95**

Recommendation:

CLARK COUNTY
REGIONAL FLOOD CONTROL DISTRICT

AGENDA ITEM

SUBJECT: 1995-96 Annual Maintenance Program for Boulder City.

PETITIONER: City of Boulder City.

RECOMMENDATION:

That the Clark County Regional Flood Control District authorize the Chairman to sign an Interlocal Contract for the 1995-96 Flood Control Facilities Annual Maintenance Program for Boulder City.

FISCAL IMPACT:

The 1995-1996 Interlocal Contract is for $87,200.00.

BACKGROUND:

The proposed contract provides for maintenance by the City of Boulder City of certain flood control facilities identified in the District's Master Plan. The work will be in accordance with Performance Standards of the Clark County Regional Flood Control District Operation and Maintenance Manual.

The Interlocal Contract will include channel inspections, cleaning & reshaping channels, vegetation control, repair of lined channels, cleaning & flushing culverts, erosion control maintenance and repair & maintenance of fencing.

See Exhibit "A" (attached) for specifics.

Respectfully submitted,

Phillip T. Henry

Phillip T. Henry, City Engineer

Boulder City, Nevada

INTERLOCAL CONTRACT
BOULDER CITY 1995-96
ANNUAL MAINTENANCE PROGRAM

THIS CONTRACT, made and entered into this _____ day of _____ _____, 1995, by and between the CITY OF BOULDER CITY, a political subdivision of the State of Nevada, hereinafter referred to as "City", and the CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT, hereinafter referred to as "District."

W I T N E S S E T H:

WHEREAS, pursuant to Chapter 543 of the Nevada Revised Statutes, the District may approve and fund projects to maintain flood control improvements; and

WHEREAS, the City desires to maintain flood control improvements within the City in accordance with the maintenance program set forth herein, and hereinafter referred to as "Project"; and

WHEREAS, the facility upon which maintenance will be done is a facility described in the District's Master Plan.

NOW, THEREFORE, in consideration of the covenants, conditions, agreements and promises of the parties hereto, the District authorizes the Project as it is mutually understood and agreed as follows:

SECTION I - SCOPE OF PROJECT

This Interlocal Contract applies to the maintenance of flood control facilities, which are identified in the District's Master Plan facilities including updates and amendments subsequently approved. The basic improvements to the facility will be: channel inspections, cleaning and reshaping channels, vegetation control, repair of lined channels, cleaning and flushing culverts, erosion control maintenance and repair, and maintenance of fencing. The Project is more specifically described in Exhibit "A" which is attached hereto and by this reference incorporated herein.

SECTION II - PROJECT COSTS

The District agrees to provide reimbursement for Project costs within the limits specified below:

1. The Project costs shall not exceed $87,200.00. The amounts allocated to each individual facility within the Project must be specified in Exhibit "A." Any changes to said allocated amounts must be approved by the District's Chief Engineer.

2. "Authorization to Proceed" is herein granted for maintenance of facilities in Exhibit "A" in an amount not to exceed $25,000.00, effective July 1.

3. A separate request for an "Authorization to Proceed" will be required for additional facility maintenance funds.

4. A written request must be made to the District and a Supplemental Interlocal Contract approved to increase the amount noted above prior to payment of any additional funds.

5. The City and District will comply with Section 4.12 of the Operation and Maintenance Manual. In accordance with said manual the City shall submit invoices together with a detailed summary report of the maintenance service performed. The City shall submit an Invoice Voucher prepared in duplicate in the manner prescribed by the District. The vouchers shall include such information as is necessary for the District to determine the nature of all expenditures. Each voucher will clearly indicate that it is for services rendered in performance of maintenance activities under this contract and is composed of completed elements set forth in the annual work program. All invoices must be submitted for payment to:

Clark County Regional Flood Control District
301 East Clark Avenue, Suite 301
Las Vegas, Nevada 89101
Attention: Gale Fraser
General Manager/Chief Engineer

Payment shall be considered timely if made by the District within 45 days. Pursuant to Section IV, Paragraph 6, the District may, in its sole discretion, withhold payments to the City for services rendered if the City fails to satisfactorily comply with any term or condition of this contract and/or the District's Operation and Maintenance Manual.

SECTION III - PROJECT TIME

The City agrees to perform the Project to the satisfaction of the District prior to June 30, 1996. The District may grant extensions or terminate this contract and require all sums advanced to the City to be repaid if the City fails to perform by said date.

SECTION IV - GENERAL

1. The city will complete the Project as set forth in Exhibit "A". The City staff personnel responsible for coordination work under this contract are as listed below:

Mr. Alan F. Gove, Director of Public Works
City Engineer
Mr. Howard Clarke, Public Works Superintendent

It is understood that staff named above will be responsible for work coordination throughout the period of this contract unless the District is informed in writing of changes in these personnel assignments.

2. In addition to the specific terms set forth in this Contract the parties hereto shall be subject to and governed by the District's Operation and Maintenance Manual, and any applicable portions of the Policies and Procedures adopted by the District.

3. It is the intent of the District that scheduling of maintenance and repair of drainage and flood control facilities in general and Master Plan Facilities specifically be coordinated among entities. Therefore, in those cases where Master Plan approved and District-funded projects have regional flood control significance impacting more than one entity, the City will allow all impacted entities an opportunity to review the maintenance schedule in order to coordinate maintenance efforts.

4. The Chief Engineer of the District shall be responsible for monitoring the performance of the City, approval for payment of billings and expenses submitted by the City and the acceptance of any reports provided by the City. The City shall be responsible for monitoring performance of City staff or private contractors, and the City shall maintain detailed records of all payments made to contractors and make such records available to the District upon request.

5. The City shall provide right of access to its facilities to the District or Chief Engineer at all reasonable times, in order to monitor and evaluate performance, compliance, and/or quality assurance under this contract.

6. In the event the City fails to perform the maintenance according to the standards specified in this contract and in the District's Operation and Maintenance Manual, the District may perform or cause to be performed the maintenance necessary to assure proper operation of the facility. Cost incurred by the District shall be reimbursed by the City or be deducted from the amount authorized by this contract. The District may not exercise the right without giving the City specific written notice of the maintenance required and allowing the City 60 days within which to perform said maintenance. The notice required by this provision must be sent to:

Mr. Alan F. Gove, Director of Public Works
401 California Avenue
P. O. Box 61350
Boulder City, NV 89006-1350

7. The records of the City and/or private contractors pertaining to the subject matter of this contract shall at all reasonable times be subject to inspection and audit by the District, County Auditor or an Agent of the District.

8. If any provision of this contract shall be deemed in conflict with any statute or rule of law, such provision shall be deemed modified to be in conformance with said statute or rule of law.

9. All parties to this contract shall comply with applicable local, state, and federal laws.

10. Any costs found to be improperly allocated in the project will be refunded by the City to the District.

11. It is specifically understood and agreed to by and between the parties hereto that it is not intended by any of the provisions of any part of this contract to create in the public or any member thereof a third party beneficiary hereunder, or to authorize anyone not a party to this contract to maintain a suit for personal injuries or property damage pursuant to the terms or provisions of this contract.

12. The City hereby indemnifies and shall defend and hold harmless the District, its representatives and their employees (or their authorized representatives) from and against any and all suits, actions, legal or administrative proceedings, claims, demands, damages, liabilities, interest, attorney's fees, costs and expenses whatsoever of any kind or nature whether arising before or after completion of the work hereunder and in any manner directly or indirectly caused, occasioned or contributed to in whole or in part, by reason of any act, omission, fault or negligence whether active or passive of the City, of anyone acting under its direction or control, or on its behalf in connection with or incident to the performance of this Contract. The City's aforesaid indemnity and hold harmless obligations, or portions or applications thereof, shall apply to the fullest extent permitted by law, but in no event shall they apply to liability caused by the sole negligence or willful misconduct of the party indemnified or held harmless.

AGENDA ITEM

SUBJECT:
FLOOD CONTROL FACILITY MAINTENANCE

PETITIONER:

M. J. MANNING, DIRECTOR OF PUBLIC WORKS

RECOMMENDATION OF PETITIONER:
THAT THE REGIONAL FLOOD CONTROL DISTRICT APPROVE THE INTERLOCAL CONTRACT FOR THE MAINTENANCE OF FLOOD CONTROL FACILITIES IN THE UNINCORPORATED AREAS OF CLARK COUNTY.

FISCAL IMPACT:

$ 1,301,700.00 FUNDED BY THE REGIONAL FLOOD CONTROL DISTRICT

BACKGROUND:

The Clark County Regional Flood Control District has programmed funds for the maintenance of flood control facilities which are shown on the Master Plan. Clark County Public Works is proposing this Interlocal Contract to provide funds to maintain those facilities shown on the Master Plan and located in the unincorporated areas of Clark County. The maintenance program is identified in Exhibit "A" of the Interlocal Contract.

INTERLOCAL CONTRACT

ANNUAL MAINTENANCE PROGRAM

THIS CONTRACT, made and entered into this __ day of _____, 1995, by and between the County of Clark, a political subdivision of the State of Nevada, hereinafter referred to as "County", and the CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT, hereinafter referred to as "District".

W I T N E S S E T H

WHEREAS, pursuant to Chapter 543 of the Nevada Revised Statutes, the District may approve and fund projects to maintain flood control improvements; and

WHEREAS, The County desires to maintain flood control improvements located in (see Exhibit "A") accordance with the maintenance program set forth herein, and hereinafter referred to as "Project"; and

WHEREAS, the facility upon which maintenance will be done is a facility described in the District's Master Plan.

NOW, THEREFORE, in consideration of the covenants, conditions, agreements, and promises of the parties hereto, the District authorizes the Project as it is mutually understood and agreed as follows:

SECTION I - SCOPE OF PROJECT

This Interlocal Contract applies to the maintenance of flood control facilities, which are identified in the District's Master Plan facilities including updates and amendments subsequently approved. The basic maintenance to the facilities will be in accordance with

performance standards of the Operations and Maintenance Manual. The Project is more specifically described in Exhibit "A" which is attached hereto and by this reference incorporated herein.

SECTION II - PROJECT COSTS

The District agrees to provide reimbursement for Project costs within the limits specified below:

1. The Project costs shall not exceed $1,301,700.00. The amounts allocated to each individual facility within the Project must be specified in Exhibit "A". Any changes to said allocated amounts must be approved by the District's Chief Engineer.

   A written request must be made to the District and a Supplemental Interlocal Contract approved to increase the amount noted above prior to payment of any additional funds.

2. The County and District will comply with Section 4.12 of the Operation and Maintenance Manual. In accordance with said manual the County shall submit invoices together with a detailed summary report of the maintenance service performed. The County shall submit an Invoice Voucher prepared in duplicate in the manner prescribed by the District. The vouchers shall include such information as is necessary for the District to determine the nature of all expenditures. Each voucher will clearly indicate that it is for services rendered in performance under this contract. Each voucher will also be accompanied by a written certification from the County stating that it is for performance of maintenance activities under this contract and is composed of completed elements set forth in the annual work program.

All invoices must be submitted for payment to:

Clark County Regional Flood Control District
301 E. Clark Avenue, Suite 301
Las Vegas, Nevada 89101
Attn: Gale Wm. Fraser, P.E.
General Manager/Chief Engineer

Payment shall be considered timely if made by the District within 45 days. Pursuant to Section IV, Paragraph 6, the District may, in its sole discretion, withhold payments to the County for services rendered if the County fails to satisfactorily comply with any term or condition of this contract and/or the District's Operation and Maintenance Manual.

SECTION III - PROJECT TIME

The County agrees to perform the Project to the satisfaction of the District prior to June 30, 1996. The District may grant extensions or terminate this contract and require all sums advanced to the County to be repaid if the County fails to perform by said date.

SECTION IV - GENERAL

1. The County will complete the Project as set forth in Exhibit "A". The County staff personnel responsible for coordination work under this contract are as listed below:
M. J. Manning, Director of Public Works, or his designee:
It is understood that staff named above will be responsible for work coordination throughout the period of this contract unless the District is informed in writing of changes in these personnel assignments.

2. In addition to the specific terms set forth in this Contract the parties hereto shall be subject to and governed by the District's Operation and Maintenance Manual, and any applicable portions of the Policies and Procedures adopted by the District.

3. It is the intent of the District that scheduling of maintenance and repair of drainage and flood control facilities in general and Master Plan Facilities specifically be coordinated among entities. Therefore, in those cases where Master Plan approved,

and District - funded projects have regional flood control significance impacting more than one entity, the County will allow all impacted entities an opportunity to review the maintenance schedule in order to coordinate maintenance efforts.

4. The Chief Engineer of the District shall be responsible for monitoring the performance of the County, approval for payment of billings and expenses submitted by the County, and the acceptance of any reports provided by the County. The County shall be responsible for monitoring performance of County staff or private contractors, and the County shall maintain detailed records of all payments made to contractors and make such records available to the District upon request.

5. The County shall provide right of access to its facilities to the District or Chief Engineer at all reasonable times, in order to monitor and evaluate performance, compliance, and/or quality assurance under this contract.

6. In the event the County fails to perform the maintenance according to the standards specified in this contract and in the District's Operation and Maintenance Manual, the District may perform or cause to be performed the maintenance necessary to assure proper operation of the facility. Cost incurred by the District shall be reimbursed by the County or be deducted from the amount authorized by this contract. The District may not exercise this right without giving the County specific written notice of the maintenance required and allowing the County 60 days within which to perform said maintenance.

The notice required by this provision must be sent to:

M. J. Manning, Director
Department of Public Works
6655 W. Sahara Ave. Bldg. C-204
Las Vegas, Nevada 89102

7. The records of the County and/or private contractors pertaining to the subject matter of this contract shall at all reasonable times be subject to inspection and audit by the District, County Auditor or an Agent of the District.

8. If any provision of this contract shall be deemed in conflict with any statute or rule of law, such provision shall be deemed modified to be in conformance with said statute or rule of law.

9. All parties to this contract shall comply with applicable local, state, and federal laws.

10. Any costs found to be improperly allocated in the project will be refunded by the County to the District.

11. It is specifically understood and agreed to by and between the parties hereto that it is not intended by any of the provisions of any part of this contract to create in the public or any member thereof a third party beneficiary hereunder, or to authorize anyone not a party to this contract to maintain a suit for personal injuries or property damage pursuant to the terms of provisions of this contract.

12. The County hereby indemnifies and shall defend and hold harmless the District, its representatives and their employees (or their authorized representatives) from and against any and all suits, actions, legal or administrative proceedings, claims, demands, damages, liabilities, interest, attorney's fees, costs and expenses whatsoever of any kind or nature whether arising before or after completion of the work hereunder and in any manner directly or indirectly caused, occasioned or contributed to in whole or in

part, by reason of any act, omission, fault or negligence whether active or passive of the County, of anyone acting under its direction or control, or on its behalf in connection with or incident to the performance of this Contract. The County's aforesaid indemnity and hold harmless obligations, or portions or applications thereof, shall apply to the fullest extent permitted by law, but in no event shall they apply to liability caused by the sole negligence or willful misconduct of the party indemnified or held harmless.

IN WITNESS WHEREOF: The parties have caused this contract to be executed the day and year first above written.

REGIONAL FLOOD CONTROL DISTRICT

AGENDA ITEM

SUBJECT: Interlocal Agreement 1995/1996 Maintenance Work Program
PETITIONER: City of Henderson

RECOMMENDATION OF PETITIONER:

That the Clark County Regional Flood Control District approve the 1995/1996 Interlocal Agreement for the Maintenance Work Program.

FISCAL IMPACT: $168,299.00 from Maintenance funds.

BACKGROUND: The 1995/1996 Maintenance Work Program has been developed to maintain Regional Flood Control facilities within the City of Henderson. The locations of the facilities to be maintained are shown on Exhibit "A" of the proposed Interlocal Agreement, and the work to be performed is described in the work program which is attached.

Respectfully submitted,

Mark T. Calhoun

Mark T. Calhoun, P.E.
Director of Public Works

INTERLOCAL CONTRACT

1995/1996 ANNUAL MAINTENANCE PROGRAM

THIS CONTRACT, made and entered into this _____ day of _____, 1995, by and between the CITY OF HENDERSON, a political subdivision of the State of Nevada, hereinafter referred to as "City", and the CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT, hereinafter referred to as "District".

W I T N E S S E T H:

WHEREAS, pursuant to Chapter 543 of the Nevada Revised Statutes, the District may approve and fund projects to maintain flood control improvements; and

WHEREAS, the City desires to maintain flood control improvements within the City in accordance with the maintenance program set forth herein, and hereinafter referred to as "Project"; and

WHEREAS, the facility upon which maintenance will be done is a facility described in the District's Master Plan.

NOW, THEREFORE, in consideration of the covenants, conditions, agreements, and promises of the parties hereto, the District authorizes the project as it is mutually understood and agreed as follows:

SECTION I - SCOPE OF PROJECT

This Interlocal Contract applies to the maintenance of flood control facilities, which are identified in the District's Master Plan facilities including updates and amendments subsequently approved. The basic maintenance to the facilities will be in accordance with performance standards of the Operation and Maintenance Manual. The Project is more specifically described in Exhibit "A", which is attached hereto, and by this reference incorporated herein.

SECTION II - PROJECT COSTS

The District agrees to provide reimbursement for Project costs within the limits specified below:

1. The Project costs shall not exceed $168,299.00.

The amounts allocated to each individual facility within the Project must be specified in Exhibit A. Any changes to said allocated amounts must be approved by the Chief Engineer of the Clark County Regional Flood Control District.

A written request must be made to the District and a Supplemental Interlocal Contract approved to increase the amount noted above prior to payment of any additional funds.

2. The City and District will comply with Section 4.12 of the Operation and Maintenance Manual. In accordance with said manual the City shall submit invoices together with a detailed summary report of the maintenance service performed. The City shall submit an Invoice Voucher prepared in duplicate in the manner prescribed by the District. The vouchers shall include such information as is necessary for the District to determine the nature of all expenditures. Each voucher will clearly indicate that it is for services rendered in performance under this contract. Each voucher will also be accompanied by a written certification from the City stating that it is for performance of maintenance activities under this contract and is composed of completed elements set forth in the annual work program. All invoices must be submitted for payment to:

Gale W. Fraser, II, P.E., General Manager/Chief Engineer
Clark County Regional Flood Control District
301 East Clark, Suite 301
Las Vegas, NV 89101

Payment shall be considered timely if made by the District within 45 days. Pursuant to Section IV, Paragraph 6, the District may, in its sole discretion, withhold payments to the City for services rendered if the City fails to satisfactorily comply with any term or condition of this contract and/or the District's Operation and Maintenance Manual.

SECTION III - PROJECT TIME

The City agrees to perform the Project to the satisfaction of the District prior to June 30, 1996. The District may grant extensions or terminate this contract and require all sums advanced to the city to

be repaid if the City fails to perform by said date.

SECTION IV - GENERAL

1. The City will complete the Project as set forth in Exhibit "A". The City staff personnel responsible for coordination work under this contract are as listed below:

Mark T. Calhoun, Director of Public Works
W. Curtis Chandler, Land Development Manager
Carl Noyes, Support Services Manager

It is understood that staff named above will be responsible for work coordination throughout the period of this contract unless the District is informed in writing of changes in these personnel assignments.

2. In addition to the specific terms set forth in this Contract, the parties hereto shall be subject to and governed by the District's Operation and Maintenance Manual, and any applicable portions of the Policies and Procedures adopted by the District.

3. It is the intent of the District that scheduling of maintenance and repair of drainage flood control facilities in general and Master Plan Facilities specifically be coordinated among entities. Therefore, in those cases where Master Plan approved and District-funded projects have regional flood control significance impacting more than one entity, the City will allow all impacted entities an opportunity to review the maintenance schedule in order to coordinate maintenance efforts.

4. The Chief Engineer of the District shall be responsible for monitoring the performance of the City, approval for payment of billings and expenses submitted by the City and the acceptance of any reports provided by the City. The City shall be responsible for monitoring performance of City staff or private contractors, and the City shall maintain detailed records of all payments made to contractors and make such records available to the District upon request.

5. The City shall provide right of access to its facilities to the District or Chief Engineer at all reasonable times, in order to monitor and evaluate performance, compliance, and/or quality assuran

under this contract.

6. In the event the City fails to perform the maintenance according to the standards specified in this contract and in the District's Operation and Maintenance Manual, the District may perform or cause to be performed the maintenance necessary to assure proper operation of the facility. Cost incurred by the District shall be reimbursed by the city or be deducted from the amount authorized by this contract. The District may not exercise this right without giving the City specific written notice of the maintenance required and allowing the City 60 days within which to perform said maintenance. The notice required by this provision must be sent to:

Mark T. Calhoun, Director of Public Works
240 Water Street
Henderson, NV 89015

7. The records of the City and/or private contractors pertaining to the subject matter of this contract shall at all reasonable times be subject to inspection and audit by the District, County Auditor, or an Agent of the District.

8. If any provision of this contract shall be deemed in conflict with any statute or rule of law, such provision shall be deemed modified to be in conformance with said statute or rule of law.

9. All parties to this contract shall comply with applicable local, state, and federal laws.

10. Any costs found to be improperly allocated in the project will be refunded by the City to the District.

11. It is specifically understood and agreed to by and between the parties hereto that it is not intended by any of the provisions of any part of this contract to create in the public or any member thereof a third party beneficiary hereunder, or to authorize anyone not a party to this contract to maintain a suit for personal injuries or property damage pursuant to the terms or provisions of this contract.

12. The City hereby indemnifies and shall defend and hold harmless the District, its representatives and their employees (or their authorized representatives) from and against any and all

suits, actions, legal or administrative proceedings, claims, demands, damages, liabilities, interest, attorney's fees, costs and expenses whatsoever of any kind or nature whether arising before or after completion of the work hereunder and in any manner directly or indirectly caused, occasioned or contributed to in whole or in part, by reason of any act, omission, fault or negligence whether active or passive of the City, of anyone acting under its direction or control, or on its behalf in connection with or incident to the performance of this Contract. The City's aforesaid indemnity and hold harmless obligations, or portions or applications thereof, shall apply to the fullest extent permitted by law, but in no event shall they apply to liability caused by the sole negligence or willful misconduct of the party indemnified or held harmless.

CLARK COUNTY

REGIONAL FLOOD CONTROL DISTRICT

AGENDA ITEM

SUBJECT:

INTERLOCAL CONTRACT - ANNUAL MAINTENANCE PROGRAM

PETITIONER:

CITY OF LAS VEGAS

RECOMMENDATION OF PETITIONER:

That the District approve this Interlocal Contract for the maintenance of Regional Flood Control facilities for FY 95-96.

FISCAL IMPACT:

CONTRACT AMOUNT IS $896,500 WITH AUTHORIZATION TO PROCEED IN THE AMOUNT OF $225,000 EFFECTIVE JULY 1, 1995.

BACKGROUND:

The District has contracted with its member entities for the maintenance of Regional Flood Control facilities located within their corporate boundaries. This Interlocal Contract will provide funding for the City of Las Vegas Maintenance Program outlined in Exhibits "A" and "B" to this Interlocal Contract.

Respectfully submitted,

Richard D. Goecke, Director
Department of Public Works

TAC AGENDA ITEM# Date:	RFCD AGENDA ITEM# Date:

INTERLOCAL CONTRACT

ANNUAL MAINTENANCE PROGRAM

THIS CONTRACT, made and entered into this _____day of _____, 1995, by and between the CITY OF LAS VEGAS, a political subdivision of the State of Nevada, hereinafter referred to as "CITY", the CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT, hereinafter referred to as "DISTRICT".

W I T N E S S E T H

WHEREAS, pursuant to Chapter 543 of the Nevada Revised Statutes, the DISTRICT may approve and fund projects to maintain flood control improvements; and

WHEREAS, the CITY desires to maintain flood control improvements within the CITY in accordance with the maintenance program set forth on the attached Exhibits "A" and "B" and hereinafter referred to as "PROJECT"; and

WHEREAS, the facilities upon which maintenance will be done are facilities described in the DISTRICT's Master Plan.

NOW, THEREFORE, in consideration of the covenants, conditions, agreements, and promises of the parties hereto, the DISTRICT authorizes the PROJECT as it is mutually understood and agreed as follows:

SECTION I - SCOPE OF PROJECT

This Interlocal Contract applies to the maintenance of flood control facilities, which are identified in the DISTRICT's Master Plan Update. The basic maintenance activities will be: channel inspections, cleaning and reshaping channels, vegetation control, repair of lined channels, cleaning and flushing

culverts, erosion control maintenance and repair, and maintenance of fencing. The PROJECT is more specifically described in Exhibits "A" and "B" which are attached hereto and by this reference incorporated herein.

SECTION II - PROJECT COSTS

The District agrees to provide reimbursement for PROJECT costs within the limits specified below:

1. The PROJECT costs shall not exceed $896,500. The amounts allocated to each individual facility within the Project must be specified in Exhibit "A". Any changes to said allocated amounts must be approved by the DISTRICT's Chief Engineer.
2. "Authorization to Proceed" is herein granted for maintenance of facilities in Exhibit "A" in an amount not to exceed $225,000 effective July 1, 1995.
3. A separate request for an "Authorization to Proceed" will be required for additional facility maintenance funds.
4. A written request must be made to the DISTRICT and a Supplemental Interlocal Contract approved to increase the amount noted above prior to payment of any additional funds.
5. The CITY and DISTRICT will comply with Section 4.12 of the Operation and Maintenance Manual. In accordance with said manual the CITY shall submit invoices together with a detailed summary report of the maintenance service performed. The CITY shall submit an invoice voucher prepared in duplicate in the manner prescribed by the

DISTRICT. The vouchers shall include such information as is necessary for the DISTRICT to determine the nature of all expenditures. Each voucher will clearly indicate that it is for services rendered in performance under this Contract. Each voucher will also be accompanied by a written certification from the CITY stating that it is for performance of maintenance activities under this Contract and is composed of completed elements set forth in the annual work program.

All invoices must be submitted for payment to:

Clark County Regional Flood Control District
301 East Clark Avenue-Suite 301
Las Vegas, Nevada 89101
Attention: Gale Wm. Fraser II, P.E.
General Manager/Chief Engineer

Payment shall be considered timely if made by the DISTRICT within 45 days. Pursuant to Section IV, Paragraph 6, the DISTRICT may, in its sole discretion, withhold payments to the CITY for services rendered if the CITY fails to satisfactorily comply with any term or condition of this Contract and/or the DISTRICT's Operation and Maintenance Manual.

SECTION III - PROJECT TIME

The CITY agrees to perform the PROJECT to the satisfaction of the DISTRICT prior to June 30, 1996. The DISTRICT may grant extensions or terminate this Contract and require all sums advanced to the CITY to be repaid if the CITY fails

to perform by said date.

SECTION IV - GENERAL

1. The CITY will complete the PROJECT as set forth in Exhibits "A" and "B". The CITY staff personnel responsible for coordination work under this Contract are as listed below:

Richard D. Goecke, Director of Public Works

Charles Kajkowski, City Planning Engineer

It is understood that staff named above will be responsible for work coordination throughout the period of this Contract unless the DISTRICT is informed in writing of changes in these personnel assignments.

2. In addition to the specific terms set forth in this Contract, the parties hereto shall be subject to and governed by the DISTRICT's Operation and Maintenance Manual and any applicable portions of the Policies and Procedures adopted by the DISTRICT.

3. It is the intent of the DISTRICT that scheduling of maintenance and repair of drainage and flood control facilities in general and Master Plan Facilities specifically be coordinated among entities. Therefore, in those cases where Master Plan approved and DISTRICT-funded projects have regional flood control significance impacting more than one entity, the CITY will allow all impacted entities an opportunity to review the maintenance schedule in order to coordinate maintenance efforts.

4. The Chief Engineer of the DISTRICT shall be responsible for monitoring the performance of the CITY, approval for payment of billings and expenses submitted by the CITY and the acceptance of any reports provided by the CITY. The CITY shall be responsible for monitoring performance of CITY staff or private contractors and the CITY shall maintain detailed records of all payments made to contractors and make such records available to the DISTRICT upon request.

5. The CITY shall provide right of access to its facilities to the Chief Engineer of the DISTRICT at all reasonable times in order to monitor and evaluate performance, compliance, and/or quality assurance under this Contract.

6. In the event the CITY fails to perform the maintenance according to the standards specified in this Contract and in the DISTRICT's operation and Maintenance Manual, the DISTRICT may perform or cause to be performed the maintenance necessary to assure proper operation of the facility. Costs incurred by the DISTRICT shall be reimbursed by the CITY or be deducted from the amount authorized by this Contract. The DISTRICT may not exercise this right without giving the CITY specific written notice of the maintenance required and allowing the CITY 60 days within which to perform said maintenance.

. . .

. . .

The notice required by this provision must be sent to:

Richard D. Goecke, Director of Public Works
City of Las Vegas
400 East Stewart Avenue
Las Vegas, Nevada 89101

7. The records of the CITY and/or private contractors pertaining to the subject matter of this Contract shall at all reasonable times be subject to inspection and audit by the DISTRICT, County Auditor or an Agent of the DISTRICT.

8. If any provision of this Contract shall be deemed in conflict with any statute or rule of law, such provision shall be deemed modified to be in conformance with said statute or rule of law.

9. All parties to this Contract shall comply with applicable local, state and federal laws.

10. Any costs found to be improperly allocated in the PROJECT will be refunded by the CITY to the DISTRICT.

11. It is specifically understood and agreed to by and between the parties hereto that it is not intended by any of the provisions of any part of this Contract to create in the public or any member thereof a third-party beneficiary hereunder or to authorize anyone not a party to this Contract to maintain a suit for personal injuries or property damage pursuant to the terms and provisions of this Contract.

12. The CITY hereby indemnifies and shall defend and hold harmless the DISTRICT, its representatives and their employees (or their authorized representatives) from and against any and all suits, actions, legal or administrative proceedings, claims, demands, damages, liabilities, interest, attorney's fees, costs and expenses whatsoever of any kind or nature whether arising before or after completion of the work hereunder and in any manner directly or indirectly caused, occasioned or contributed to in whole or in part, by reason of any act, omission, fault or negligence whether active or passive of the CITY, of anyone acting under its direction or control or on its behalf in connection with or incident to the performance of this Contract. The CITY's aforesaid indemnity and hold harmless obligations, or portions or applications thereof, shall apply to the fullest extent permitted by law but, in no event,

. . .

. . .

. . .

. . .

. . .

. . .

. . .

. . .

shall they apply to liability caused by the sole negligence or willful misconduct of the party indemnified or held harmless.

IN WITNESS WHEREOF, this INTERLOCAL CONTRACT is hereby executed as of the date first set forth above.

CLARK COUNTY

REGIONAL FLOOD CONTROL DISTRICT

AGENDA ITEM

SUBJECT: Interlocal Agreement 1995/1996 Maintenance Work Program

PETITIONER: City of Mesquite

RECOMMENDATION OF PETITIONER:

That the Clark County Regional Flood Control District approve the 1995/1996 Interlocal Agreement for the Maintenance Work Program.

FISCAL IMPACT: $44,760 from Maintenance funds.

BACKGROUND: The 1995/1996 Maintenance Work Program has been developed to maintain Regional Flood Control facilities within the City of Mesquite. The locations of the facilities to be maintained are shown on Exhibit "A" of the proposed Interlocal Agreement, and the work to be performed is described in the work program which is attached.

Respectfully submitted,

Allen Bell, P.E.
Director of Public Works

INTERLOCAL CONTRACT

CITY OF MESQUITE

ANNUAL MAINTENANCE PROGRAM

THIS CONTRACT, made and entered into this ____ day of _____, 1995, by and between the CITY OF MESQUITE, a political subdivision of the State of Nevada, hereinafter referred to as "City", and the CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT, hereinafter referred to as "District".

W I T N E S S E T H:

WHEREAS, pursuant to Chapter 543 of the Nevada Revised Statutes, the District may approve and fund projects to maintain flood control improvements; and

WHEREAS, the City desires to maintain flood control improvements within the City in accordance with the maintenance program set forth herein, and hereinafter referred to as "Project"; and

WHEREAS, the facility upon which maintenance will be done is a facility described in the District's Master Plan.

NOW THEREFORE, in consideration of the covenants, conditions, agreements, and promises of the parties hereto, the District authorizes the Project as it is mutually understood and agreed as follows:

SECTION I - SCOPE OF PROJECT

This Interlocal Contract applies to the maintenance of flood control facilities, which are identified in the District's Master Plan facilities including updates and amendments subsequently approved. The basic maintenance to the facilities will be in accordance with performance standards of the Operation and Maintenance Manual. The Project is more specifically described in Exhibit "A", which is attached hereto, and by this reference incorporated herein.

SECTION II - PROJECT COSTS

The District agrees to provide reimbursement for Project costs within the limits specified below:

1. The project costs shall not exceed $44,760.00.

The amounts allocated to each individual facility within the Project are specified in Exhibit

A. Any changes to said allocated amounts must be approved by the Chief Engineer of the Clark County Regional Flood Control District.

A written request must be made to the District and a Supplemental Interlocal Contract approved to increase the amount noted above prior to payment of any additional funds.

2. The City and District will comply with Section 4.12 of the Operation and Maintenance Manual. In accordance with said manual, the City shall submit invoices together with a detailed summary report of the maintenance service performed. The City shall submit an Invoice Voucher prepared in duplicate in the manner prescribed by the District. The vouchers shall include such information as is necessary for the District to determine the nature of all expenditures. Each voucher will clearly indicate that it is for services rendered in performance under this contract. Each voucher will also be accompanied by a written certification from the City stating that it is for performance of maintenance activities under this contract and is composed of completed elements set forth in the annual work program. All invoices must be submitted for payment to:

Clark County Regional Flood Control District
301 East Clark Avenue, Suite 301
Las Vegas, NV 89101
Attention: Gale Wm. Fraser, II, P.E.
General Manager/Chief Engineer

Payment shall be considered timely if made by the District within 45 days. Pursuant to Section IV, Paragraph 6, the District may, in its sole discretion, withhold payments to the City for services rendered if the City fails to satisfactorily comply with any term or condition of this contract and/or the District's Operation and Maintenance Manual.

SECTION III - PROJECT TIME

The City agrees to perform the Project to the satisfaction of the District, prior to June 30, 1996. The District may grant extensions or terminate this contract and require all sums advanced to the City to be repaid if the City fails to perform by said date.

SECTION IV - GENERAL

1. The City will complete the project as set forth in Exhibit "A". The City staff personnel responsible for coordination work under this contract are as listed below:

Allen Bell, Flood Control Administrator
Paul Henderson, City Manager

It is understood that the staff named above will be responsible for work coordination throughout the period of this contract unless the District is informed in writing of changes in these personnel assignments.

2. In addition to the specific terms set forth in this Contract, the parties hereto shall be subject to and governed by the District's Operation and Maintenance Manual, and any applicable portions of the policies and procedures adopted by the District.

3. It is the intent of the District that scheduling of maintenance and repair of drainage and flood control facilities in general and Master Plan facilities specifically be coordinated among entities. Therefore, in those cases where Master plan approved, the District-funded projects have regional flood control significance impacting more than one entity, the City will allow all impacted entities an opportunity to review the maintenance schedule in order to coordinate maintenance efforts.

4. The Chief Engineer of the District shall be responsible for monitoring the performance of the City, approval for payment of billings an and expenses submitted by the City and. the acceptance of any reports provided by the City. The City shall be responsible for monitoring performance of City staff or private contractors, and the City shall maintain detailed records of all payments made to contractors and make such records available to the District upon request.

5. The City shall provide right of access to its facilities to the District or Chief Engineer at all reasonable times, in order to monitor and evaluate performance, compliance, and/or quality assurance under this contract.

6. In the event the City fails to perform the maintenance according to the standards specified in this contract and in the District's Operation and Maintenance Manual, the District may perform or cause to be performed the maintenance necessary to assure proper operations of the facility. Cost incurred by the District shall be reimbursed by the City or be deducted from the amount authorized by this contract. The District may not exercise this right without giving the City specific written notice of the maintenance required and allowing the City 60 days within which to perform said maintenance. The notice required by this provision must be sent to:

Allen Bell, Flood Control Administrator
City of Mesquite
P.O. Box 69
Mesquite, NV 89024

7. The records of the City and/or private contractors pertaining to the subject matter of this contract shall at all reasonable times be subject to inspection and audit by the District, County Auditor or an Agent of the District.

8. If any provision of this contract shall be deemed in conflict with any statute or law, such provision shall be deemed modified to be in conformance with said statute or rule of law.

9. All parties to this contract shall comply with applicable local, state, and federal laws.

10. Any costs found to be improperly allocated in the project will be refunded by the City to the District.

11. It is specifically understood and agreed to by and between the parties hereto that it is not intended by any of the provisions of any part of this contract to create in the public or any member thereof a third party beneficiary hereunder, or to authorize anyone not a party to this contract to maintain a suit for personal injuries or property damage pursuant to the terms or provisions of this contract.

12. The City hereby indemnifies and shall defend and hold harmless the District, its representatives and their employees (or their authorized representatives) from and against any and all suits, actions, legal or administrative proceedings, claims, demands, damages, liabilities, interest, attorney's fees, costs and expenses whatsoever of any kind or nature whether arising before or after completion of the work hereunder and in any manner directly or indirectly caused, occasioned or contributed to in whole or in part, by reason of any act, omission, fault or negligence whether active or passive of the City, of anyone acting under its direction or control, or on its behalf in connection with or incident to the performance of this Contract. The City's aforesaid indemnity and hold harmless obligations, or portions or applications thereof, shall apply to the fullest extent permitted by law, but in no event shall they apply to liability caused by sole negligence or willful misconduct of the party indemnified or held harmless.

CLARK COUNTY

REGIONAL FLOOD CONTROL DISTRICT

AGENDA ITEM

SUBJECT: Interlocal Contract for the 1995/96 Annual Maintenance Program
PETITIONER: James A. Bell, P.E., Public Works Deputy Director City of North Las Vegas

RECOMMENDATION OF PETITIONER:

It is recommended that the Clark County Regional Flood Control District Board approve and authorize the Chairman to sign the Interlocal Contract for the 1995/96 Annual Maintenance Program

FISCAL IMPACT:

$237,015

BACKGROUND:

The proposed contract provides for maintenance by the City of North Las Vegas of certain flood control facilities identified in the District's Master Plan. The work will be in accordance with performance standards of the Clark County Regional Flood Control District's Operation and Maintenance Manual. The program is more specifically described in Exhibit "A" of the proposed contract attached.

Respectfully submitted,

TAC AGENDA ITEM # **Date:**	**RFCD AGENDA ITEM #** **Date:**

INTERLOCAL CONTRACT
ANNUAL MAINTENANCE PROGRAM

THIS CONTRACT, made and entered into this _____ day of _____, 1995, by and between the City of North Las Vegas, a political subdivision of the State of Nevada, hereinafter referred to as "City"; and the Clark County Regional Flood Control District, hereinafter referred to as "District".

WITNESSETH

WHEREAS, pursuant to Chapter 543 of the Nevada Revised Statutes, the District may approve and fund projects to maintain flood control improvements; and

WHEREAS, the City desires to maintain flood control improvements located on The 1995/96 Annual Maintenance Work Plan in accordance with the maintenance program set forth herein and hereinafter referred to as "Project", and

WHEREAS, the facility upon which maintenance will be done is a facility described in the District's Master Plan.

NOW, THEREFORE, in consideration of the covenants, conditions, agreements, and promises of the parties hereto, the District authorizes the Project as it is mutually understood and agreed as follows:

SECTION I - SCOPE OF PROJECT

This interlocal contract applies to the maintenance of flood control facilities which

are identified in the District's Master Plan, including updates and amendments subsequently approved. The basic maintenance of the facilities will be in accordance with performance standards of the Operation and Maintenance Manual. The Project is more specifically described in Exhibit "A" which is attached hereto and by this reference incorporated herein.

SECTION II-PROJECT COSTS

The District agrees to provide reimbursement for Project cost within the limits specified below:

1. The Project costs shall not exceed $237,015. The amounts allocated to each individual facility within the Project must be specified in Exhibit "A". Any changes to said allocated amounts must be approved by the District's Chief Engineer.

A written request must be made to the District and a supplemental interlocal contract approved to increase the amount noted above prior to payment of any additional funds.

2. The City and District will comply with Section 4.12 of the Operation and Maintenance Manual. In accordance with said manual, the City shall submit invoices together with a detailed summary report of the maintenance service performed. The City shall submit an invoice voucher prepared in duplicate in the manner prescribed by the District. The vouchers shall include such information as is necessary for the

District to determine the nature of all expenditures. Each voucher will clearly indicate that it is for services rendered in performance under this contract. Each voucher will also be accompanied by a written certification from the City stating that it is for performance of maintenance activities under this contract and is composed of completed elements set forth in annual work program.

All invoices must be submitted for payment to:

Clark County Regional Flood Control District
301 East Clark Avenue, Suite 301
Las Vegas, Nevada 89101
Attention: Gale Wm. Fraser, II, P.E.
General Manager/Chief Engineer

Payment shall be considered timely if made by the District within 45 days. Pursuant to Section IV, Paragraph 6, the District may, in this sole discretion, withhold payment to the City for services rendered if the City fails to satisfactorily comply with any term or condition of this contract and/or the District's Operation and Maintenance Manual.

SECTION III-PROJECT TIME

The City agrees to perform the Project to the satisfaction of the District prior to June 30, 1996. The District may grant extensions or terminate this contract and require all sums advanced to the City to be repaid if the City fails to perform by said date.

SECTION IV-GENERAL

1. The City will complete the Project as set forth in Exhibit "A". The City staff personnel responsible for coordination work under this contract are as listed below:

Gary W. Holler, P.E., Director of Public Works, or his designee.

It is understood that staff named above will be responsible for work coordination throughout the period of this contract unless the District is informed in writing of changes in these personnel assignments.

2. In addition to the specific terms set forth in this contract, the parties hereto shall be subject to and governed by the District's Operation and Maintenance Manual and any applicable portions of the Policies and Procedures adopted by the District.

3. It is the intent of the District that scheduling of maintenance and repair of drainage and flood control facilities in general and Master Plan facilities specifically be coordinated among entities. Therefore, in those cases where Master Plan approved and District-funded projects have regional flood control significance impacting more than one entity, the City will allow all impacted entities an op portunity to review the maintenance schedule in order to coordinate maintenance

efforts.

4. The Chief Engineer of the District shall be responsible for monitoring the performance of the City, approval for payment of billings and expenses submitted by the City, and the acceptance of any reports provided by the City. The City shall be responsible for monitoring performance of City staff or private contractors, and City shall maintain detailed records of all payments made to contractors and make such records available to the District upon request.

5. The City shall provide right of access to its facilities to the District or Chief Engineer at all reasonable times in order to monitor and evaluate performance, compliance, and/or quality assurance under this contract.

6. In the event the City fails to perform the maintenance according to the standards specified in this contract and in the District's Operation and Maintenance Manual, the District may perform or cause to be performed the maintenance necessary to assure proper operation of the facility. Cost incurred by the District shall be reimbursed by the City or be deducted from the amount authorized by this contract. The District may not exercise this right without giving the City specific written notice of the maintenance required and allowing the City 60 days within which to perform said maintenance.

The notice required by this provision must be sent to:

Gary W. Holler, P.E.
Director of Public Works
City of North Las Vegas
Post Office Box 4086
North Las Vegas, Nevada 89036-4086

7. The records of the City and/or private contractors pertaining to the subject matter of this contract shall, at all reasonable times, be subject to inspection and audit by the District, County Auditor, or an agent of the District.

8. If any provision of this contract shall be deemed in conflict with any statute or rule of law, such provision shall be deemed modified to be in conformance with said statute or rule of law.

9. All parties to this contract shall comply with applicable local, state, and federal laws.

10. Any costs found to be improperly allocated in the project will be refunded by the City to the District.

11. It is specifically understood and agreed to by and between the parties hereto that it is not intended by any of the provisions of any part of this contract to create in the public or any member thereof a third party beneficiary hereunder, or to authorize anyone not a party to this contract to maintain a suit for personal injuries or property damage pursuant to the terms or provisions of this contract.

12. The City hereby indemnifies and shall defend and hold harmless the District its representatives and their employees (or their authorized representatives) from and against any and all suits, actions, legal or administrative proceedings, claims, demands, damages, liabilities, interest, attorney's fees, costs or expenses whatsoever of any kind or nature whether arising before or after completion of the work hereunder and in any manner directly or indirectly caused, occasioned, or contributed to in whole or in part, by reason of any act, omission, fault, or negligence, whether active or passive of the City, of anyone acting under its direction or control or on its behalf in connection with or incident to the performance of this Contract. The City's aforesaid indemnity and hold harmless obligations, or portions of applications thereof, shall apply to the fullest extent permitted by law but in no event shall they apply to liability caused by the sole negligence or willful misconduct of the party indemnified or held harmless.

IN WITNESS WHEREOF, the parties have caused this contract to be executed the day and year first above written.

AGENDA ITEM

SUBJECT:

RFCD OPERATIONS AND MAINTENANCE MANUAL - 1995 REVIEW

PETITIONER:

GALE WM. FRASER, II, P.E., GENERAL MANAGER/CHIEF ENGINEER

RECOMMENDATION OF PETITIONER:

ADOPT THE AMENDMENTS TO THE RFCD OPERATIONS AND MAINTENANCE MANUAL AND AUTHORIZATION TO REPRODUCE AND DISTRIBUTE THE MANUAL TO APPROPRIATE ENTITY STAFF AT NO COST

FISCAL IMPACT:

$200 (estimated - Fund 286)

BACKGROUND:

In 1990, the District authorized URS Consultants to prepare the District *Operations and Maintenance Manual*, in accordance with NRS 543.340(4) and the Uniform Regulations. The original document, prepared through the District with the support and cooperation of each affected Entity, was ultimately adopted by the Board on November 8, 1990.

In accordance with Section 4.21 of the Operations and Maintenance Manual, the manual is being updated at this time to reflect fiscal implications and experience gained.

Staff recommends adoption of the proposed amendments to the *Operations and Maintenance Manual* effective upon Board approval, and authorization to reproduce and distribute updated manuals to the appropriate Public Works staffs.

Respectfully submitted,

Gale Wm. Fraser, II, P.E.
General Manager/Chief Engineer

CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT
OPERATIONS AND MAINTENANCE MANUAL

CHAPTER 1
EXECUTIVE SUMMARY

1.10 EXECUTIVE SUMMARY

The Clark County Regional Flood Control District (District) was created under NRS 543 with responsibility to plan, construct and maintain drainage and flood control facilities throughout Clark County. In order to comply with NRS 543.340(4), this Operations and Maintenance Manual has been prepared through the cooperation and support of all of the affected Entities in the County. The document sets forth both policies and procedures by which the maintenance of the drainage and flood control facilities will be achieved to assure their proper working order at the time of need. The overall goal of the maintenance program as adopted by the District Board is as follows:

> *Comply with the provisions of NRS 543.340(4) and assure that facilities in the master plan are maintained in a manner that maximizes their useful life and ensures their operation at design capacity during a storm event.*

Ten policy statements were also adopted supporting the above goal.

In order to achieve the goal, and to comply with the adopted policies, the following procedures have been developed in an open and very participatory manner.

Funding Procedure - Provides for a means by which the Entities can be reimbursed for activities associated with maintenance of drainage and flood control facilities on the Master Plan provided they meet criteria as set forth in the manual.

Administrative Procedure - Provides for establishing standards and levels of service by which maintenance will be achieved. This procedure includes the steps and schedule by which an annual work plan is established and adopted by the District Board. It also provides for the certification of performance by each Entity in accordance with the annual interlocal contract. The ability for the Entity to contract maintenance activities to private contractors is also authorized under this procedure.

Maintenance Procedures - This procedure provides the specific activities under which the maintenance program is to be carried out as listed below:

ACTIVITY NUMBER	ACTIVITY NAME	WORK MEASURE UNIT
~~2.05~~	Inspect Channels	Miles
~~3.10~~	Clean and Reshape Channels	Cubic Yards
~~5.15~~	Repair Lined Channel	~~Repairs~~Each
~~11.20~~	Provide/Maintain Erosion Control	Square Feet
~~9.25~~	Clean and Inspect Detention/Debris Basins	Cubic Yards
~~12.30~~	Erosion Repair	Cubic Yards
~~14.35~~	Fence Repair	Linear Feet
~~4.40~~	Vegetation Control - Chemical	~~Gallons~~Acres
~~10.45~~	Vegetation Control ~~Detention Basins~~ - Mechanical	Acres
~~15.50~~	Maintain Access Road	Miles
~~1.55~~	Clean and Inspect Inlet/Outlet Structures	~~Structures~~Each
~~13.60~~	Repair Inlet/Out~~flowlet~~ Structures	~~Repairs~~Each
~~7.65~~	Clean Storm Sewer Lines	Linear Feet
~~8.70~~	Storm Sewer Repair	Repairs
~~6.75~~	Clean/Flush Culverts & Bridges	~~Culverts~~Each
~~16.80~~	Misc. Work Activities	Labor Hours
85	Engineering	Labor Hours

A specific performance standard has been developed for each activity setting forth the following elements:

- The most effective crew size.
- The kinds and number of equipment required.
- The major types of material that should be used.
- Recommended procedures for performing the work.
- An estimate of expected average daily accomplishment with standard crew size, equipment and procedures.
- Authorization and scheduling criteria.

Inventory Procedures - A critical element of any maintenance program is the identification and condition of the overall drainage and flood control system. In the case of this program, the inventory also identifies those facilities that are "eligible" for reimbursement of maintenance activities, provided the work is a part of the annual plan. ~~A physical inventory list was developed by each Entity and a map developed identifying those facilities on the Master Plan. The inventory and maps are incomplete due to limited available documentation, but will be updated over the next several months as Master Plans are likewise updated. This procedure also provides for a means by which new facilities are added to the inventory and mapping system.~~ Facilities eligible are those identified in the Regional Flood Control District's Master Plan and any revisions, amendments, and/or changes subsequently approved. Only those facilities that exist as Master Plan facilities, or exist in the same alignment as a proposed Master Plan facility and appurtenant facilities are eligible.

Maintenance is an ongoing and very dynamic function of a successful drainage and flood control program. This Operations and Maintenance Manual sets forth an initial set of policies and procedures, including the various actions required to achieve the maintenance goal. The manual will need to be updated on a regular basis to reflect fiscal implications and the experience gained as the District continuous to grow and to serve the citizens and tax payers of Clark County.

CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT
OPERATIONS AND MAINTENANCE MANUAL

CHAPTER 2
INTRODUCTION

2.10 BACKGROUND

The Clark County Regional Flood Control District (District) was established in 1986 to plan, construct, and maintain drainage and flood control facilities. These responsibilities focused on alleviating the potential for flooding and protecting the lives and property of District residents. The initial phases of the District's program succeeded in preparing a Master Plan, uniform design criteria, regulatory standards, and constructing facilities. As these areas have progressed, the District, along with other agencies and Entities in the County, has oriented its efforts towards assuring adequate maintenance of flood control facilities and conveyance systems. This orientation is consistent with the vital role maintenance plays in all comprehensive flood control programs. This *Operations and Maintenance Manual* has been prepared through the District with the support and cooperation of each affected Entity. It represents a commitment to uniform flood control system standards and establishes a blueprint for a cost effective and consistent maintenance program throughout the District.

2.20 AUTHORITY

Nevada Revised Statute (NRS) 543 mandates that the District shall undertake programs for both construction and maintenance of flood control facilities. A commitment to building and maintaining flood control facilities within Clark County is reiterated in the District's *Uniform Regulations for the Control of Drainage* which states that capital improvements, operation, **and** maintenance are all interrelated parts of the District's overall flood control program. In accordance with NRS 543.340(4) and the Uniform Regulations, the District authorized URS Consultants to prepare a specific *Operations and Maintenance Manual* ~~for adoption~~, which was adopted by the ~~Flood Control~~ District Board on November 8, 1990. To reflect fiscal implications and experience gained, the manual was updated in 1995.

2.30 RESPONSIBILITY

The District was formed, in part, to fund and coordinate the construction and maintenance of facilities to alleviate flooding and protect the life and property of citizens within the boundaries of the District. It is the responsibility of the District to prepare and update the Master Plan for the control of floods, and manage the Regional Fund for the Control of Floods in a manner consistent with NRS 543.

2.40 APPROACH

~~The District, to date, has undertaken an aggressive program of facility planning, regulation development and capital construction, however, the District has recognized that a maintenance program must be implemented as part of its comprehensive planning process. In addition, this~~ The maintenance program must assure that the flood control projects funded by the District are maintained at a level which maximizes their useful life and assures that facilities operate to design capacity. As an interconnected network of conveyances and structures, failure of any flood control facility to operate properly may affect the performance of the overall system within a specific watershed.

Flood control facilities require regular maintenance if they are to be functional, visually attractive, and last through their design life. Accordingly, the development of a maintenance program is just as critical to the overall success of a comprehensive flood control effort as basin planning and regulation enforcement. As stormwater and flood control programs begin to address nonpoint pollution/water quality issues, the maintenance program will play an even greater role by enabling cost effective reductions in pollutant loadings to receiving waters. Finally, visibility of the program to the public, which a comprehensive maintenance program affords, is an important factor in demonstrating that flood control management is truly a full-time commitment and not simply a priority only after a storm event. The primary objectives of the District's maintenance program are:

- To develop a complete physical feature inventory for the system.
- To establish overall policies and levels of service.
- To develop operating procedures.

It is also critical that ~~an~~ ongoing inspection and reporting ~~process be implemented~~ procedures continue to assure all systems are ready when needed.

Due to the multiple jurisdictions involved with maintenance of the flood control system, ~~the project recognized that~~ a commitment to this program from all Entities within the Flood Control District was essential. This commitment was made through the Maintenance Technical Committee during the development of the manual in 1990. It was also recognized that coordination of this maintenance program with state transportation programs was critical. The level and consistency of the long range commitment has a direct impact on how effective the resulting maintenance system becomes. This commitment begins with a credible *Operations and Maintenance Manual.*

~~As illustrated on Figure 2-1, an~~ An essential building block for a successful flood control maintenance program in Clark County is a complete physical feature inventory of the system. ~~At this time the District does not have such an inventory, although a system inventory is expected to be prepared as part of the Master Plan update process.~~ It is also important to note that no maintenance program is ever truly "complete". Rather, these programs are constantly

evolving as inventories are defined and standards/costs are further refined. A similar evolution is anticipated for this program. The flexibility to adjust to this evolutionary process has been built into this manual.

2.50 DEFINITIONS

In addition to the definitions of terms and phrases set forth in other District documents, the following apply to operation and maintenance:

Annual Budget: "Annual Budget" means the anticipated costs associated with completion of each activity outlined within the annual work plan submitted by each of the Entities, and ultimately approved by the District Board of Directors prior to the start of each fiscal year.

Annual Work Plan: "Annual work plan" means a plan submitted by each of the Entities setting forth the type and quantity of maintenance to be performed during the ensuing budget year in a form prescribed by the District specifically requesting funds for budgeting purposes.

Certification: "Certification" means the documentation which evidences that required maintenance by an Entity has been completed in accordance with established standards.

Maintenance Program: "Maintenance Program" means that program set annually by the Board based upon the annual work programs submitted by each Entity. The work activities undertaken through the Maintenance Program are funded and contracted for through the annual ~~intergovernmental agreement~~interlocal contracts between ~~the~~each Entity and the District. No matching funds are required, except in those cases where an arrangement has been made to cooperatively fund a particular field activity.

Maintenance work typically excludes local drainageway maintenance such as curb and gutter work, inlet maintenance, and repairs to small piped storm sewer systems. The Maintenance Program contains three broad categories of work.

Routine and/or Preventive Maintenance: "Routine and/or Preventive Maintenance" means work on existing facilities to keep them in proper working conditions, including but not limited to, debris/sedimentation removal, vegetative control, and reshaping.

Restoration: "Restoration" means the repair to existing facilities after a storm event including, erosion repair fence replacement, repairing/replacing trash racks, major debris removal, and similar "one time" work activity.

Rehabilitation: "Rehabilitation" means rebuilding a facility or conveyance after it is destroyed by an event or has deteriorated to the extent that it must be replaced "in kind" including, replacing drop structures, reshaping channels, bank protection restoration, etc. In general, the rehabilitative projects are designed by consultants and the construction contracts are awarded through a bid process.

Acceptance for Maintenance: "Acceptance for Maintenance" means that a project funded by the District, Entity, or other public/private funds is a part of the Master Plan and has been constructed in accordance with District standards and therefore eligible for maintenance funding by the District.

CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT
OPERATIONS AND MAINTENANCE MANUAL

CHAPTER 3
POLICY STATEMENT

It is important that a maintenance policy statement be adopted which reflects the objectives of both the elected officials and the operations staff charged with its implemention. The initial policy document was prepared and reviewed by District staff and the Maintenance Committee. Following input from the group, it was reviewed by the respective Public Works Directors of all Entities and further revised to reflect their input. The document was then reviewed by the Technical Advisory Committee (TAC) and the Citizens Advisory Committee (CAC) before ~~being presented to the Board at their June 14, 1990 meeting.~~ final adoption by the Board on November 8, 1990. The final adopted policy statement is as follows:

3.10 GOAL

Comply with the provisions of **NRS 543.340 (4)** and assure that facilities in the Master Plan are maintained in a manner that maximizes their useful life and ensures their operation at design capacity during a storm event.

3.20 POLICIES

1. Flood control facilities identified in the Master Plan are eligible for District maintenance funding.

2. As specified in the *Uniform Regulation for the Control of Drainage* **Section 12.050**, facilities funded through the District shall be inspected on an annual basis to assure proper maintenance has been provided.

3. In cases where funded maintenance by the lead Entity is not performed to the standards specified, the District shall perform or cause to be performed the maintenance necessary to assure proper operations of the facility. Costs incurred by the District shall be deducted from the amount authorized in the maintenance agreement between the lead Entity and the District.

4. Flood control facilities improved or constructed after adoption of this policy, must be designed in accordance with District criteria and standards to be eligible for maintenance funding.

5. Access to the facility must be guaranteed to the lead Entity and the District in order to be eligible for maintenance funding.

6. The maintenance requirements applied to these facilities shall be based on the standards contained in the District's *Operations and Maintenance Manual.*

7. The lead Entity must develop an annual work plan to be eligible for maintenance funds. Upon completion of the work, the Entity must certify that the work was completed in accordance with the standards contained in the District's *Operation and Maintenance Manual.*

8. Maintenance funding is available only for repair or maintenance of existing facilities and is not intended to supplement the District's capital improvement program. For example, if the intent of the field activity is to increase the designed capacity of a facility or conveyance, then that function is capital in nature.

9. All facilities eligible for maintenance funding must be publicly owned.

10. Funds may be provided by the District for maintenance of Master Plan facilities by outside contractors under conditions where the use of such an approach is deemed the most efficient and cost effective by the lead Entity.

~~The maintenance program of the District will change over time. As it evolves, this policy statement should be reviewed to assure that represents the direction and desires of the elected representatives of the District.~~

CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT
OPERATIONS AND MAINTENANCE MANUAL

CHAPTER 4
PROCEDURES

4.10 FUNDING PROCEDURES

4.11 Purpose

This element of the *Operations and Maintenance Manual* provides the Entities with procedures for the appropriation, expenditure and reimbursement of funds to perform maintenance activities. A principle role of the District shall be to manage and disburse payments to the Entities for maintenance that is performed in compliance with the approved plans. A diagram of the funding flow is shown on **Figure 4-1**.

The District has authorized funding to assist the Entities with major drainageway maintenance in accordance with the priorities listed below:

1. First priority - District owned facilities.

2. Second priority - facilities owned by other public agencies, but totally or partly financed by District funds. (Capital Improvement and Maintenance Project)

3. Third priority - facilities owned by others and constructed by others without District assistance.

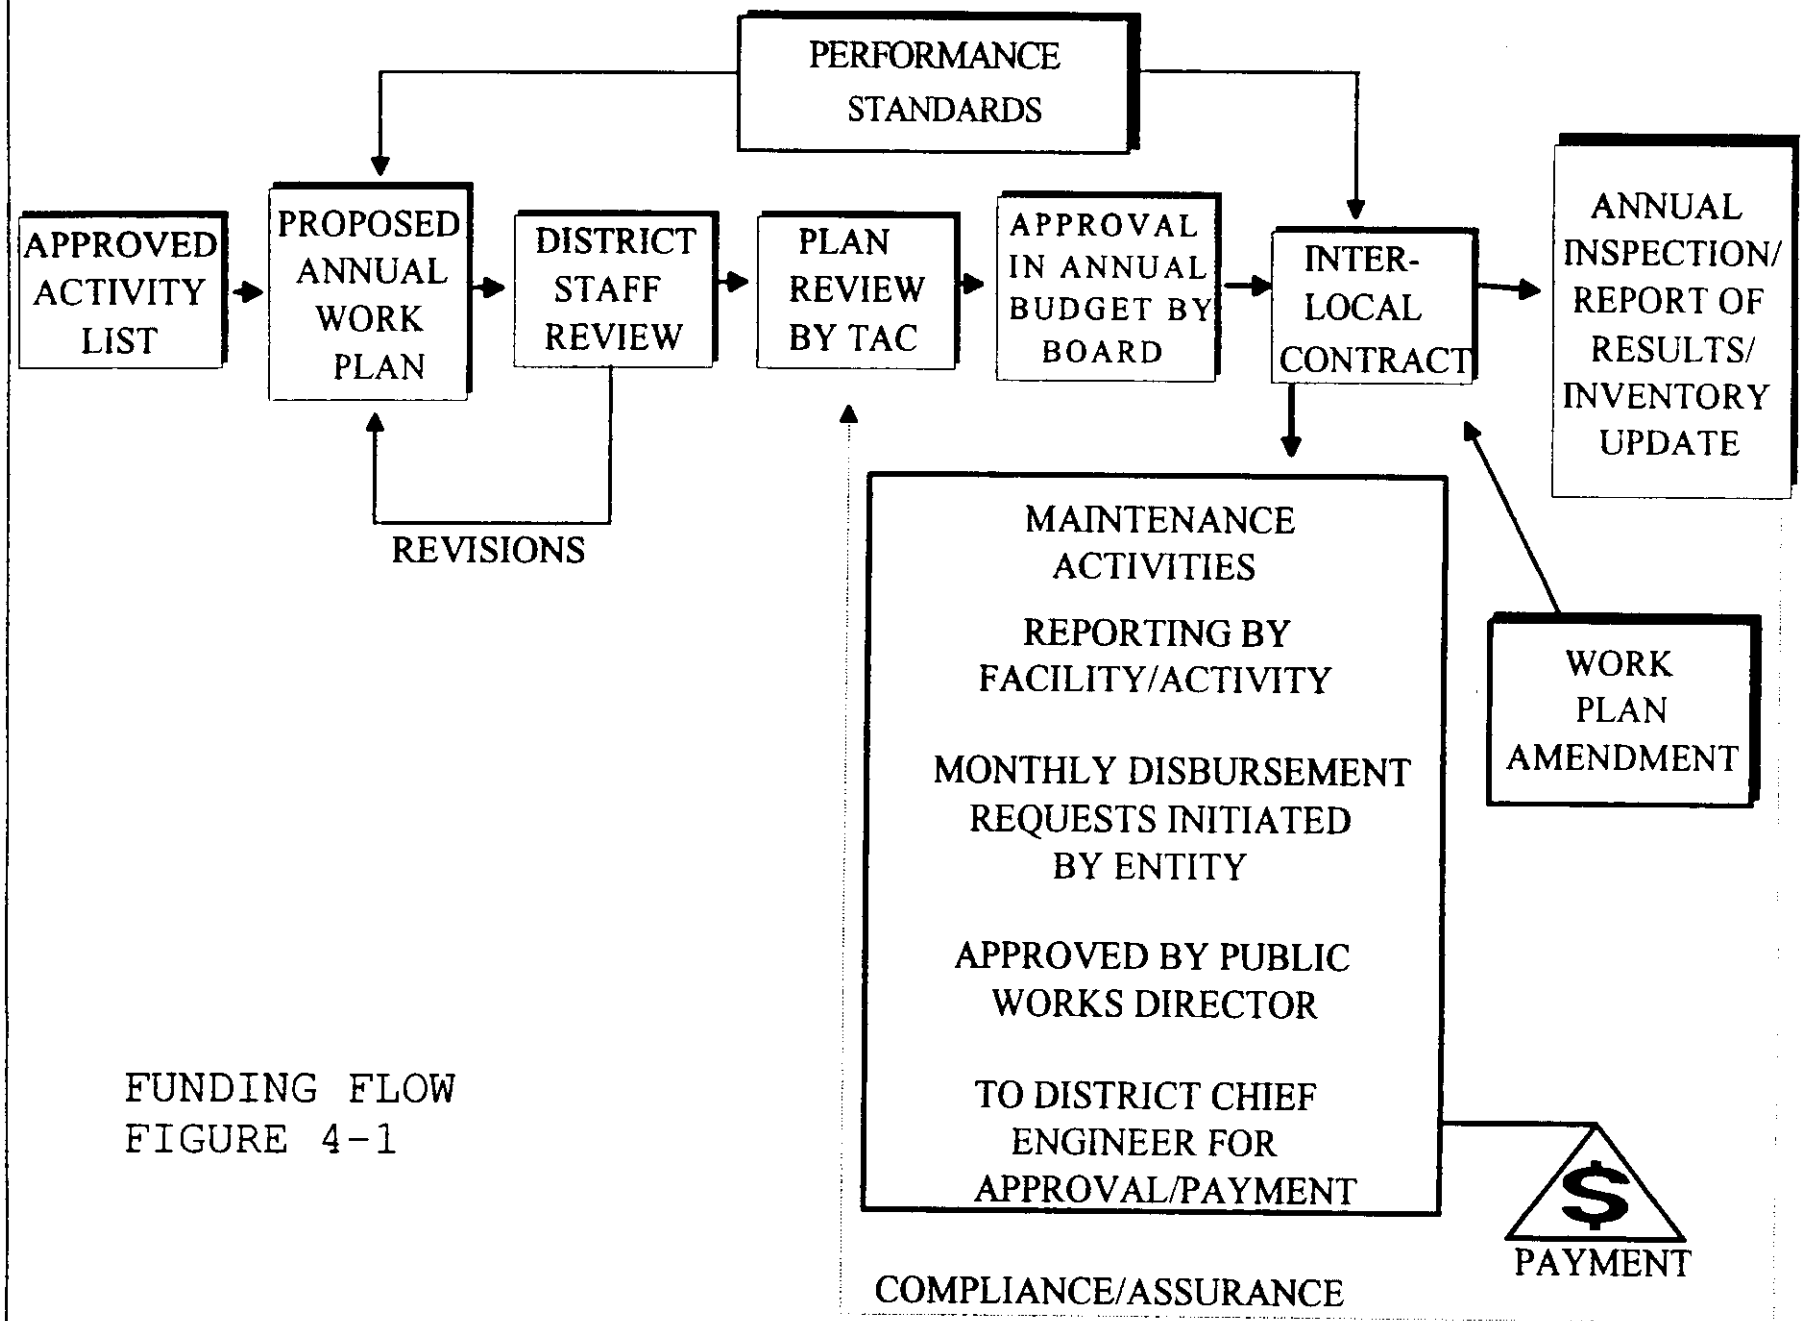
4. Fourth priority - unimproved drainageways.

Projects eligible for District maintenance funding ~~must be on the Master Plan, have plans approved by the District, or must be a part of the Master Plan prior to the adoption of this document. They must also be publicly owned facilities, or have public maintenance/access easements.~~ are those identified in the Regional Flood Control District's Master Plan and any revisions, amendments, and/or changes subsequently approved. Only those facilities that exist as Master Plan Facilities or exist in the same alignment as a proposed Master Plan facility, and appurtenant facilities are eligible.

4.12 ~~Reimbursement~~Payment Procedures

Payment for work performed will be made in accordance with the annual interlocal contract executed as part of the approved work plan and the ~~reimbursement~~payment procedures outlined herein. The primary mechanism for reimbursements shall occur through a purchase order established between the District and each Entity. ~~The purchase order shall stipulate a maximum contract amount to cover the approved work activities in the annual work plans. The purchase order agreement shall be divided into subcategories that correspond with the major work activities outlined in the approved plan. Payment requests shall be submitted on an approved District purchase order draw down request form shown on Figure 4-2.~~ In cases where the Entity directs the District to make payments to a contractor or supplier directly, the purchase

orders will be established between the District and the contractor, consultant, or supplier, at the Entity's request. Unless otherwise contained within this manual, all District *Policies and Procedures* relating to disbursement of funds and reimbursement to Entities apply.



FUNDING FLOW
FIGURE 4-1

Schedule

~~Draw down~~Disbursement requests (invoices) from each Entity may only be submitted for completed work activity and may not be submitted more than once in a 30-day period. ~~Payment~~Disbursement requests must be accompanied by a verification statement from the Entity that the work for which payment is due has been completed in accordance with the standards contained in this manual. The disbursement request ~~for payment~~must identify the Master Plan facility maintained, specific plan activity or activities for which reimbursement is sought, and separately identify personnel, equipment, and other related costs. **(Figure 4-2 represents a sample of the reporting required, and can be obtained on diskette from the District.)** Administrative costs incurred by the Entity in the management of the interlocal contract are not reimbursable. Examples include cost accounting work, secretarial/clerical work, the preparation of requests for payment, and certification statements for work performed under the contract.

All invoices from the Entities requesting reimbursement to the Entity or direct payment to the Entity contractor or vendor must first be submitted to and approved by the Entity's Public Works Director or other designated responsible person in charge of the project. The Chief Engineeror designated District staff will process and approve such payments within 30 days providing the required approval has been obtained and terms of the interlocal contract have been satisfied.

~~The District shall process payment requests from Entities within 45 days.~~ Direct payments to ~~subcontractors~~contractors ~~may be made, however, all payment requests~~ must originate from the Entity, ~~not the contractor. Requests for payments to contractors must~~ be accompanied by a written invoice to the Entity from the contractor, and a certification of work performed by the contractor signed by the Entity. ~~The District shall provide the Entity a statement regarding purchase order balances for all plan activities with each payment.~~

Reporting

Monthly and annual summaries of ~~reimbursement requests, and disbursement amounts~~ purchase order balances, budget status, and facility expenditures shall be prepared by the District as a part of the routine financial reporting procedures to the Board.

4.20 ADMINISTRATIVE PROCEDURES

4.21 Purpose

The purpose of this element of the *Operations and Maintenance Manual* is to provide specific procedures for establishing standards and levels of service, preparing the annual work plan, administrating the planning, approval and enforcement elements and updating the ~~policy and procedures~~manual over time. The principal role of the District shall be to review and approve annual maintenance work plans and monitor the performance of work activities. The principal role of the Entities shall be development of annual work plans that are consistent with the District's approved maintenance activity list; performance of the maintenance work set forth in the approved work plans; and the ~~preparation~~submittal of ~~an annual~~ quarterly reports that summarize work performance while certifying compliance with maintenance activity performance standards as set forth in the *Operations and Maintenance Manual.*

4.22 Annual Work Plans

In accordance with the schedule on the following page, each Entity shall submit a proposed annual maintenance work plan containing the following components:~~ shown on Figure 4-3 to the District in accordance with the schedule below.~~

Section 1	Program Summary by Maintenance Project Including Cost for Each Project
Section 2	Summary by Maintenance Activity
Section 3	Individual Maintenance Projects Showing Narrative, Location Map, Work Activities, Results, Costs

District staff shall review the proposed plans and work with the Entities to resolve any discrepancies found with District maintenance standards and policy objectives. After the initial staff review, the plans shall be forwarded to the ~~TAC~~Technical Advisory Committee. Lastly, the plans will be incorporated in the annual District budget and submitted to the Board for final approval.

The activities in the work plan shall be consistent with the District's approved activity list for maintenance of flood control and drainage facilities. Work plans should also describe locally funded work activities that may be linked to the District maintenance work activities to show overlapping areas of responsibility for personnel and equipment. Where local personnel and equipment are going to be used to perform both District funded activities and locally funded activities, the Entity will describe how these resources are to be managed and the procedures for tracking costs related to both sets of activities.

Entities may contract for the performance of maintenance work activities. The proposed work plan must specify that a contractor is to be utilized and the time frame for selection of a contractor. In the event that maintenance work is performed under contract, the contract must specify that the District has the authority to inspect all work performed under the contract and approve or deny payments to contractors based on inspection findings.

All work performed must comply with District approved maintenance activity performance standards as set forth in subsequent sections of this Manual. The Entity is required to inspect Master Plan facilities annually, including any maintenance work performed by Entities on Master Plan Facilities and shall notify the District prior to the annual inspection of completed maintenance work. Entities shall facilitate the inspection of maintenance work by the District. The District may withhold funding, require additional maintenance work, or seek repayment of disbursed funds when an inspection reveals that work activities were not performed in conformance with activity performance standards.

Schedule

~~November 1~~February 1	-	Submittal of preliminary work plan proposal to District staff for review~~—and~~, recommendations, and coordination with entities.
~~December 1~~	~~—~~	~~Submittal of proposed work plans to Technical Advisory Committee (TAC) for incorporation into the District budget review cycle.~~
~~March 10~~	~~—~~	~~Submittal of District budget to the Board for final review and approval.~~
April 10	-	Submittal of the Entities' final annual work plans, budgets, and interlocal contracts to TAC, CAC, and to the Board for final approval and authorization of the interlocal contracts.
July 1	-	Beginning of maintenance plan contract period.

Reporting

Each Entity will submit quarterly reports indicating the status of the work completed under the current fiscal year's program (Figure 4-3). The reports are due 30 days after the close of the quarter, and will be submitted to the Board for review. Also, each Entity shall submit an annual certification to the District stating that all work contained in the work plan and reimbursed through the interlocal contract has been performed to the specifications established in this manual.

FIGURE 4-3

4.23 Approval of Annual Work Plan

The work plans received by the District will be reviewed and budget requests compiled into a summary showing the dollar amount by Entity for each of the priority areas set forth in **Section 4.11.** The Chief Engineer shall review the total maintenance budget requests against the District's proposed annual total budget for facility maintenance and make a recommendation to the District as to the amount of maintenance funds to be disbursed to each respective Entity based upon equity and need.

Once the ~~TAC~~Technical Advisory Committee has reviewed the maintenance work plans and budget appropriation recommendation, the Chief Engineer will forward the compiled summary to the Board for consideration and approval as a key element of the Annual District Budget.

Schedule

The Entities will submit the proposed work plan to the Chief Engineer as outlined in **Section 4.22** ~~a minimum of two months prior to the month in which the Board will approve the Districts Annual Budget.~~

Reporting

The Chief Engineer's report to the District Board shall show both the budget requested by the agency and the recommended amount to be appropriated, the report will also make comments on any adjustments made to the initial request.

4.24 Work Plan and Budget Amendments

Requests for amendments to approved work plans and budgets must be submitted to the ~~District~~Chief Engineer in writing. The amendment request must specify the work elements affected, describe the reasons for the amendment request, and describe the impact of the proposed amendment on the affected work plan objectives.

Formal approval of work plan and/or budget amendments requiring a reallocation of funds between facilities must be obtained from the ~~District~~Chief Engineer prior to submittal of payment requests. **(See Figure 4-2.)** The Entity shall also notify District staff of work plan and/or budget amendments within a facility. Requests requiring an increase in the overall work plan budget must be submitted to the Board for approval with a supplemental interlocal contract for the amended work in accordance with **Section 4.6** of the ~~CCRFCD~~District *Policy and Procedures Manual.*

Schedule

Amendment requests shall be reviewed by District staff ~~for not longer than 30 days~~ and responded to in writing within 15 days of receipt of the original request. ~~Staff shall forward the amendment request to the TAC with a recommendation for action. Within 45 days after~~

~~receiving the amendment and staff recommendation, the TAC shall forward the amendment request to the board and either support the staff recommendation or prepare a separate recommendation. Final approval of amendment requests rests with the Board.~~ Work plan amendments which require an increase in the Entity's annual budget will require submittal of an item and supplemental interlocal contract for approval by the District Board of Directors.

Reporting

Annual certification of results will include addressing all amendments made to the annual work plan.

4.25 Certification of Compliance

It is the intent of the District to rely to the maximum extent possible on the Entities to carry out the maintenance activities and comply "voluntarily" with the procedures and standards set forth in this manual. The District shall from time to time inspect facilities funded by the District or those on the Master Plan to assure compliance with the interlocal contract. Each Entity shall submit an annual certification to the District stating that all work contained in the work plan and reimbursed through the interlocal contract has been performed to the specifications established in this manual. This certification shall be signed by the person executing the interlocal contract or designee. The certification should summarize proposed and actual plan accomplishments. It should also describe any major maintenance problems that have implications for the District as a whole, such as significant deterioration of major conveyance system components, or the failure of system components to perform as intended, and suggest revisions to the activity list provisions.

Schedule

The certification and final payment requests shall be submitted to the District within ~~2030~~ calendar days of the termination of the annual interlocal ~~agreement~~contract for maintenance funding.

Reporting

The certification shall be brief and may be in the form of ~~either~~ a letter ~~or a resolution~~.

4.26 Interlocal Contract Document

The performance of work outlined in the approved maintenance plan shall be guided by an interlocal contract entered into annually between the District and each Entity. ~~A s~~Sample contracts ~~is~~are contained in ~~Appendix C~~**Appendices B and C**. Major provisions of the contract include: the adoption of the Board approved work plan as the document outlining the work to be performed; references to the performance standards, reimbursement and payment procedures, and plan amendment procedures outlined in this manual for governing maintenance work performance evaluations, ~~reimbursement,~~ and contract amendments; and a requirement for submittal of an annual certification of results.

Schedule

All Entities will enter into an "annual" interlocal contract in conjunction with adoption of the District and respective agency budgets.

Reporting

Reporting requirements will be as prescribed in the respective interlocal contracts.

4.27 Contract for Maintenance Performance

Where, in the opinion Entities, it appears to be most cost effective (or due to an emergency) to utilize the services of private contractors to perform maintenance functions, the Entity shall solicit bids from qualified contractors in compliance with their statutory procedures for the necessary work. The Entity will provide to the District copies of bid specifications and bid tabulation as well as copies of the respective contract documents. All expenditures must comply with **NRS 332**, Local Government Purchasing Act, ~~and~~ **NRS 338**, the Public Works Act, **and all relevant statutes, rules, regulations, and policies**.

Schedule

All contracts for maintenance services shall be bid on an annual basis or for a specific projection location.

Reporting

The Entity shall advise the District in advance that they intend to utilize a private contractor (may be included as part of annual work plan). They shall also provide a summary of work performed, as well as a statement of inspection, as a part of the request for reimbursement to the Entity or directly by the District to the contractor.

4.3 MAINTENANCE PROCEDURES

4.31 Purpose

As a part of the overall operations and maintenance procedures adopted by the District, an outline for specific maintenance procedures has been developed. The accepted maintenance procedures are centered around specific elements of a management system for field maintenance, and include defined maintenance activities, standards, ~~and~~ scheduling, and reporting procedures.

Due to the diversity in physical features among the various agencies involved, and the varied resources employed in maintenance activities, it is essential to treat these procedures as general guidelines which must be tailored to meet the situation at hand. It is also essential that these procedures remain dynamic, ~~and~~ be actively reviewed, and periodically updated. An annual review is recommended.

4.32 Activities

Maintenance work activities identify all major maintenance work and include all activities which are performed frequently and in amounts that make them a significant part of the total work program. Each activity must be clearly defined so maintenance personnel at all levels of management uniformly understand the operation to be performed and the type of deficiency to be corrected.

Personnel who plan, schedule, perform, report, or evaluate maintenance work must know what each work activity means. Work activities are used for the following purposes:

- Planned maintenance work is identified in the annual maintenance work plan by activity name and number.
- Activity names and numbers are used for authorizing, assigning, and reporting work.
- Activity names and numbers are used on work scheduling guides and work performance summaries.

Work measurement units are established for the major maintenance activities. For example, "Acres Covered" is the work measurement unit for vegetation control while "Cubic Yards Removed" is the work unit for cleaning and reshaping channels. These measurement units are used to describe how much work is planned and to report how much work is accomplished for each activity.

For some activities, specific work measurement units--other than labor hours--would not be meaningful. For example, the miscellaneous maintenance activity includes a number of different operations. This activity cannot be measured by a common unit other than labor hours.

Following is the accepted maintenance activity list for the District including work measure units.

ACTIVITY NUMBER	ACTIVITY NAME	WORK MEASURE UNIT
2.05	Inspect Channels	Miles
3.10	Clean and Reshape Channels	Cubic Yards
5.15	Repair Lined Channel	RepairsEach
11.20	Provide/Maintain Erosion Control	Square Feet
9.25	Clean and Inspect Detention/Debris Basins	Cubic Yards
12.30	Erosion Repair	Cubic Yards
14.35	Fence Repair	Linear Feet
4.40	Vegetation Control - Chemical	GallonsAcres
10.45	Vegetation Control Detention Basins - Mechanical	Acres
15.50	Maintain Access Road	Miles
1.55	Clean and Inspect Inlet/Outlet Structures	StructuresEach
13.60	Repair Inlet/Outflowlet Structures	RepairsEach
7.65	Clean Storm Sewer Lines	Linear Feet
8.70	Storm Sewer Repair	Repairs
6.75	Clean/Flush Culverts & Bridges	CulvertsEach
16.80	Misc. Work Activities	Labor Hours
85	Engineering	Labor Hours

4.33 Standards

"Performance Standards" have been established for each of the major maintenance work activities. These performance standards specify:

- The most effective crew size.
- The kinds and number of equipment required.
- The major types of material that should be used.
- Recommended procedures for performing the work.
- An estimate of expected average daily accomplishment with standard crew size, equipment and procedures.
- Authorization and scheduling criteria.

Following is an item-by-item description of the format of the performance standards.

1. Activity Identification/Date. The activity number and name are shown as well as the "effective date" of the performance standard--to be used when updating or replacing performance standards.

2. Description and Purpose. The Description and Purpose section of the performance standards explains the work activity and the kinds of defects to be corrected or reasons for doing the work.

3. Authorized By and Work Control Category. The level of management responsible for authorizing the work is identified. Certain activities requiring special equipment, coordination, or expertise are Engineer-authorized activities and should not be scheduled or performed without the Engineer's approval.

   The type of control to be placed on the quantity of work performed is identified. This control is unlimited or limited in terms of the amount of work done (accomplishment) or the amount of labor input (crew-day).

4. Performance Criteria. This section includes important information for the "scheduler" about when to schedule the work and for the crew leader to identify the work to be done.

5. Crew Size. The crew size outlines the numbers of personnel needed to do the work. The crew size is based on average conditions. Sometimes, there will be a need to add or delete people to satisfy special traffic safety conditions or hauling requirements.

6. Equipment. The basic requirements for major pieces of equipment are listed. Situations such as the breakdown or unavailability of equipment or special materials hauling requirements may require the addition, deletion or substitution of equipment.

7. Materials. The materials section includes a list of the major materials to be used for the activity.

8. Work Method. The work method outlines, step-by-step, the recommended procedures for performing the work. Each step should be performed in order to correctly maintain the feature as well as provide the quality of work desired.

9. Average Daily Production. The average daily production is an estimate of the amount of work a crew can accomplish during a day using the recommended crew size, equipment, materials and work method. This estimate is shown as a range and should be attainable over a period of time. Some days the accomplishment may be more or less than the estimate, but eventually, the average should fall in line.

10. Notes. Any other relevant, helpful information or instructions.

Use of Performance Standards

Maintenance supervisory personnel should become thoroughly familiar with these performance standards. It is important that the performance standards be used when making assignments and performing work. Some situations will require deviation from the performance standards--such as more or less flagmen or additional haul trucks. These situations are recognized, and crew leaders are expected to consider such situations when organizing and managing their activities.

Haul truck needs should be determined using factors such as haul distance and time estimates (spot, dump, load, and cycle times.)

The performance standards also provide guidance and a measure for supervisors to use when evaluating work in progress and completed.

Field personnel are in the best position to identify new or better work methods or difficulties with the current performance standards. These suggestions for improvements or questions should be directed to the crew leader or supervisor.

The performance standards should be reviewed and updated annually. If other changes occur that require more frequent review and update or development, the performance standards can be changed to suit these needs.

4.34 Scheduling

The objectives of work scheduling are:

- To do the planned amount of work.
- To perform the work when it should be done.
- To do the work where it should be done.
- To use the proper people, equipment and supplies to do the work.

Three tools are available to help supervisors meet these objectives. The WORK PROGRAM defines the estimated amount of work and the estimated labor-days required for each activity to provide the desired levels of service; a WORK CALENDAR helps to establish when the various activities should be done; and the PERFORMANCE STANDARDS provide information about quantity standards, personnel requirements and how much work can be done in a given time.

The annual work program establishes the kinds and amount of work to be done during the year and the resources that will be required to do that work. This annual plan needs to be broken into a monthly plan for effective scheduling of work and to permit timely evaluations of work program performance.

The process of "distributing" the annual work load throughout the year is done by allocating a part of the work (in labor-hours, by activity) to specific months. Some types of work -- emergency or service activities -- must be done throughout the year as the need arises. Other types of work must be done on a regularly scheduled basis -- such as preventive maintenance work. Finally, some types of work can be done during certain periods but can be shifted from one month to the other, and still other work can be done almost any time during the year.

These factors must be considered when distributing the different types of work. Preventive maintenance and other types of work which must be performed on a regularly scheduled basis are distributed so as to level labor power needs as much as possible. Finally, work which can be performed any time is distributed to those months with the fewest labor-days. In this way, staffing needs are kept as uniform as possible resulting in more efficient use of available labor power.

A work calendar lists -- activity by activity -- the labor-hours for each month. These labor-hours are used in conjunction with the work program annual work quantities for work scheduling and the preparation of periodic Activity Status Reports. A sample work calendar is included on **Figure 4-4**.

Once the work program and staffing levels have been set, the work load distribution can be finalized and the calendar prepared to summarize/communicate the planned monthly distribution of the work program.

Work scheduling is the process of using the Work Calendar and specific scheduling procedures to plan ahead, establish work priorities and accomplish the work.

The performance standards outlined in the previous sections apply to corrective and preventive maintenance activities. These procedures are not as rigid or foolproof as implied by the description. Equipment breakdowns, emergencies, or bad weather will disrupt a schedule -- but part of the scheduling process is to be aware that these situations will occur and to be prepared to respond with little or no difficulty. Because of these situations, supervisors should <u>not</u> expect to accomplish <u>all</u> of the work as scheduled. Generally, a supervisor can consider his scheduling efforts to be successful if 75 to 80 percent of the scheduled work is completed as planned.

FIGURE 4-4

Following are some additional hints or techniques to consider:

- It is not necessary to "formally schedule" the daily, routine activities. It is necessary, however, to regularly check the work reports and accomplishments to verify the distribution of work assignments. A periodic review and adjustment of the work assignments may be necessary to maintain a "balanced work load."

- It is usually best to prepare a schedule (and work assignments) assuming everything will work as planned -- no equipment breakdowns, no emergencies, etc. But make sure a backlog of "alternate" work is available so that little time is wasted when adjustments to the schedule must be made.

- Some guidelines for identifying alternate work:

  + Low priority work that needs to be done, but not necessarily during the next week or so.

  + Work that does not require special equipment or a lot of preparation time.

  + Preventive maintenance on light equipment.

- Take time to estimate the amount of work needed and the number of hours required to do the work. Good estimates will improve the scheduling process significantly. The performance standards, inspections and sound judgment based on experience all help the estimating process.

PERFORMANCE STANDARD

CLARK COUNTY
REGIONAL FLOOD CONTROL DISTRICT

ACTIVITY NUMBER	NAME	DATE
05	INSPECT CHANNELS	6/95

DESCRIPTION & PURPOSE

Inspect both improved and unimproved flood channels for proper cross-section, sedimentation, debris and erosion damage, in order to schedule cleaning or repairs as needed.

AUTHORIZED BY	LIMITS ON WORK
Maintenance Supervisor	

PERFORMANCE CRITERIA

Perform complete inspection of channels on an annual basis and after major storm events.

CREW SIZE

- 1 Crew Supervisor
- 1 TOTAL

EQUIPMENT

- 1 Pickup

WORK METHOD

1. Use safety devices, as required.
2. Visually inspect channels for cross-section, sediment, debris, erosion, and vegetation.
3. Prioritize a list of channels requiring maintenance.
4. Schedule cleaning of channels referring to prioritized list.

MATERIAL

AVERAGE DAILY PRODUCTION

8 miles/day

PERFORMANCE STANDARD

CLARK COUNTY
REGIONAL FLOOD CONTROL DISTRICT

ACTIVITY NUMBER	NAME	DATE
10	CLEAN & RESHAPE CHANNELS	6/95

DESCRIPTION & PURPOSE

Mechanical silt, ~~and~~ vegetation, and debris removal, and reshaping of unlined channels to restore adequate flow.

AUTHORIZED BY	LIMITS ON WORK
Maintenance Supervisor	

PERFORMANCE CRITERIA

Improved earth channels should be scheduled for cleaning and reprofiling on an annual schedule, or as appropriate following a flood event. Natural channels on a 3-year cycle.

CREW SIZE

- 2 Equipment Operators
- 1 Truck Driver
- .5 Foreman
- 3.5 TOTAL

EQUIPMENT

- 1* 10-wheel Dump Truck
- 1 Scraper
- 1 Gradall

WORK METHOD

1. Set up safety devices as required.
2. Remove silt and vegetation.
3. Load and haul removed material to proper disposal site.
4. Reshape channel.
5. Clean up work site.
6. Remove safety devices.

MATERIAL

- *Disposal Fees*

AVERAGE DAILY PRODUCTION

300 Cubic Yards/day

NOTES:

*Schedule sufficient trucks to insure maximum utilization of excavation equipment.

PERFORMANCE STANDARD

CLARK COUNTY
REGIONAL FLOOD CONTROL DISTRICT

ACTIVITY NUMBER	NAME	DATE
15	REPAIR LINED CHANNELS	6/95

DESCRIPTION & PURPOSE

Repair of damaged concrete, rip rap, gabion, or other channel linings, retaining walls, etc., to restore to original condition and prevent further deterioration.

AUTHORIZED BY	LIMITS ON WORK
Maintenance Supervisor	

PERFORMANCE CRITERIA

Repairs of channel linings, retaining walls, and other structures critical to the protection of a facility are to be scheduled immediately upon detection of damage.

CREW SIZE

- 1 Maintenance Foreman
- 2 Maintenance Workers
-
-
- 3 TOTAL

EQUIPMENT

- Pickup
- Flatbed Dump
- Concrete Mixer
-
-
-

WORK METHOD

1. Obtain from storekeeper safety equipment, materials, tools necessary for the day's work.
2. Begin applicable safety procedures and/or traffic control.
3. Clean and prepare damaged area.
4. Build and place forms as necessary.
5. Place and finish concrete.
6. Remove forms and backfill.

MATERIAL

- Assorted lumber
- 6-30 bags sacked concrete
- 3-15 tons concrete gravel mix
- 2-10 CY ready-mix concrete

AVERAGE DAILY PRODUCTION

NOTES:

Crew size and equipment may vary significantly depending on urgency, extent and complexity of repair.

PERFORMANCE STANDARD

CLARK COUNTY
REGIONAL FLOOD CONTROL DISTRICT

ACTIVITY NUMBER	NAME	DATE
20	PROVIDE / MAINTAIN EROSION CONTROL	6/95

DESCRIPTION & PURPOSE

Placement of rip rap, sand bags, or other erosion control materials and repair of damaged areas of erosion protection to restore material to original condition. This work is done to prevent further deterioration and eliminate potential erosion problems.

AUTHORIZED BY	LIMITS ON WORK
Maintenance Supervisor	

PERFORMANCE CRITERIA

Work is to be scheduled when damage or deterioration is severe enough to present potential erosion problems. Erosion undercutting roadways, sidewalks, or prepared embankments/improvements shall be repaired immediately. Repair of undermined stabilizers shall be scheduled immediately.

CREW SIZE

- 1 Foreman
- 2 Equipment Operators
- 2 Maintenance Workers
-
- 5 TOTAL

EQUIPMENT

- 1 Truck Crane

55	CLEAN & INSPECT INLET/OUT~~FLOWLET~~ STRUCTURES	6/95

DESCRIPTION & PURPOSE

Cleaning and inspection of catch basins, inlets, sumps, grates, outflow and other structures to remove silt and debris and to inspect for structural integrity and proper functioning.

AUTHORIZED BY	LIMITS ON WORK
Maintenance Supervisor	

PERFORMANCE CRITERIA

Plan for structures to be inspected and cleaned a miminum of once per year. Annual cleaning shall be the major effort to allow thorough inspection of structure in order to schedule repairs.

CREW SIZE

- .25 Foreman
- 2 Maintenance Workers
- 2.25 TOTAL

EQUIPMENT

- 1 1-Ton Truck
- 1 Water Tanker (1500 gal)
- -or-
- 1 High Pressure Vacuum (Vactor)
- Appropropriate Hand Tools

WORK METHOD

1. Perform daily vehicle P.M. check and check equipment.
2. Place signs/traffic control devices as required.
3. Locate truck in the best working psoition and as far off roadway as practical.
4. Remove grate. Then remove debris, trash & sediment from grate.
5. Loosen solids with spade if necessary.
6. Flush/vacuum basin.
7. Inspect structure visually to determine if further cleaning or repair is necessary.
8. Dispose of debris at designated dump site.
9. Check and clean equipment after use.

MATERIAL

- Water

AVERAGE DAILY PRODUCTION

15 ~~Structures~~Each/day

ACTIVITY NUMBER	NAME	DATE
65	CLEAN STORM SEWER LINES	6/95

DESCRIPTION & PURPOSE

The removal of debris of any type from within conduits by: flushing with water; the use of a sewer cleaning machine; or by physicially entering the conduit and manually removing debris, to restore full capacity.

AUTHORIZED BY	LIMITS ON WORK
Maintenance Supervisor	

PERFORMANCE CRITERIA

Plan cleaning of storm sewer lines on an average 5-year cycle. Specific areas may require annual cleaning while others will require less than 5-year cleaning.

CREW SIZE

- 1 Maintenance Foreman
- 2 Maintenance Workers
- 3 TOTAL

EQUIPMENT

- 1 Sewer Cleaner

WORK METHOD

1. Obtain from storekeeper safety equipment and tools necessary for the day's work.
2. Begin applicable safety procedures and/or traffic control.
3. Remove debris from conduit.
4. Load debris and haul to designated disposal site if necessary.
5. Clean up work area as necessary.

MATERIAL

- 0-5,000 Gallons Water

AVERAGE DAILY PRODUCTION

1500 linear feet/day

NOTES:

Work should be scheduled whenever possible, in conjunction with annual cleaning of adjacent structures.

PERFORMANCE STANDARD

CLARK COUNTY
REGIONAL FLOOD CONTROL DISTRICT

ACTIVITY NUMBER	NAME	DATE
70	STORM SEWER LINE REPAIR	6/95

DESCRIPTION & PURPOSE

Excavation and repair of storm sewer lines to eliminate blockages and repair failed pipes.

AUTHORIZED BY	LIMITS ON WORK
Maintenance Supervisor	

PERFORMANCE CRITERIA

Priority of repairs:

1. *eliminate blockages and hazards to public safety;*
2. remove flow restrictions and repair damaged/failed pipe sections.

CREW SIZE

- 1 Foreman
- 1 Equipment Operator
- 2 Maintenance Workers
-
- 4 TOTAL

EQUIPMENT

- 1 Dump Truck
- 1 Backhoe/Util Tractor
- 1 Air Compressor w/accessories
- Appropropriate Hand Tools
-
-

WORK METHOD

1. Set up warning signs and traffic control devices.
2. Take necessary measures to control flow -- providing uninterrupted service whenever possible.
3. Cut pavement and/or excavate to the extent required to determine necessary scope of repairs.
4. Remove flow restrictions, as necessary.
5. Backfill and compact in lifts to within 10 inches of surface.
6. Place select material (rock or shell) and compact to within 2 inches of surface* (See Note below.)
7. Coordinate density test and request repaving as required.
8. Clean work area. Remove signs and warning devices.
9. Record work accomplishment.

MATERIAL

- Pipe/fittings
- Sand
- Cement
- Rock
- Asphalt, as required
-

AVERAGE DAILY PRODUCTION

1 Repair/day

NOTES:

Verify location of other utilities prior to excavaction.

*Backfill specifications apply to paved areas. In easements and other unpaved areas, backfill and compact in 2-foot lifts to grade; re-sod as necessary. Install safety fence and secure jobsite at end of workday as required.

PERFORMANCE STANDARD

CLARK COUNTY
REGIONAL FLOOD CONTROL DISTRICT

ACTIVITY NUMBER	NAME	DATE
75	CLEAN / FLUSH ~~PIPES &~~ CULVERTS & BRIDGES	6/95

DESCRIPTION & PURPOSE

Cleaning/flushing of culverts and bridges to remove silt and debris, and eliminate restriction to flow.

AUTHORIZED BY	LIMITS ON WORK
Maintenance Supervisor	

PERFORMANCE CRITERIA

Plan for all culverts to be cleaned/flushed annually.

CREW SIZE

- 1 Maintenance Supervisor
- 1 Maintenance Worker
-
-
- 2 TOTAL

EQUIPMENT

- 1 1-Ton Dump Truck
- 1 Water Tanker (1500 gal)
- -or- High Pressure/Vacuum cleaner/Vactor
- Safety Equipment
- Appropriate Hand Tools

WORK METHOD

1. Place signs and safety devices.
2. Locate truck in best working position and as far off roadway as possible.
3. Clean out ends of culvert.
4. Flush culverts until flow is unrestricted.
5. Load excess material/debris into truck for disposal at designated dump area.
6. Pick up signs and safety devices.

MATERIAL

4.35 Reporting

Comprehensive maintenance programs include procedures for reporting and summarizing work accomplished and labor-hours used for maintenance activities. This information enables managers and supervisors to compare actual performance with the planned work program. These planned-actual comparisons -- on a regular basis -- are essential for effective management and control of the work program.

The reporting procedures provide specific information:

- What Master Plan facility required work.
- What work was done by activity.
- How much of each activity was done.
- The labor-hours used to accomplish the work.

This information is used by managers in their effort to:

- Make sure the right kinds and amounts of maintenance work are done.
- Identify the problem areas and related corrective actions.
- Develop future work programs and budgets.
- Identify opportunities for improved productivity.

The work reporting process can consist of a simple form as outlined in the following section.

Daily Work Activity Report

The Daily Work Activity Report may be used to record and summarize (1) the kinds and amounts of work performed by maintenance personnel, and (2) the number of labor-hours used to do that work. The report can be used to summarize all work activities. Each Entity may use its standard accounting/reporting procedures for the Daily Work Activity Report.

The Maintenance Supervisor or crew leader usually prepares the Daily Work Activity Report. Following are instructions for the completion of the sample report shown on **Figure 4-5**.

1. Identification Data -- Fill in all blanks: the Entity, date, ~~and~~ name of person preparing the report, and the names and employee numbers of all persons to perform work to be reported for the day. (The form provides for several combinations of activities and employees. If ~~a second page is~~additional pages ~~are~~ needed, number ~~that second page~~ the pages accordingly).

~~2. Employee Name -- Enter in the diagonal blanks the names of all persons to perform work to be reported. Hours of leave or absenteeism should also be reported since it is helpful to account for all personnel.~~

2. Master Plan Facility Number - Enter the specific 4 digit-4 letter Master Plan Facility number (and reach, if possible). (This number directly corresponds to the specific Master Plan location as identified on current MP maps.)

3. MWP Facility Number - Enter the identifying Maintenance Work Plan facility number. (This number directly corresponds to the budget approved for the facility and will typically include a range of Master Plan facilities and reach.)

~~3~~4. Activity Number -- Enter the number of each activity performed. Use the Work Activity Directory or Performance Standards to complete the blank.

5. Employee Number - Enter the employee number of the person working a specific activity at the specific facility.

6. Hours Worked by Each Employee -- Record the number of hours worked by each employee, by the appropriate activity. Record the time spent to the nearest quarter-hour. For example, record 1 hour and 45 minutes as ~~2.01~~1.75 hours and 3 hours and 20 minutes as ~~3.03~~3.25 hours.

~~Be sure each employee has the full day's work recorded.~~

~~4.~~7. Equipment Number -- Enter the assigned equipment number for any mechanical equipment on which work was performed for preventive and corrective maintenance only.

~~5.~~8. Work Performed -- Enter the location and a brief description of the work performed.

~~7. Total Hours -- Total all hours for each activity, and record in the space designated as "Total Hours."~~

8. Accomplishment -- Measure and record the amount of work done on each activity. Use the correct measurement unit for each activity -- see the Activity Directory.

Record the amount of work done to the nearest whole unit. Record labor-hours to the nearest hour. For activities with labor-hours as the unit of measure, the "quantity" will be exactly the same as "total hours" for the activity.

9. Notes/Comments -- Record any additional relevant information that may be of use in summarizing and analyzing work activity data.

The completed reports ~~are to be held~~can be used for monthly summarization and report preparation, and serve as completion certification backup for the monthly force account reimbursement billings. ~~After this process, the completed reports, which serve as documentation of completed work, should be filed and retained in accordance with local filing and retention policies.~~

Supervisor's Signature **Title**

Page _____ of _____

FIGURE 4-5

FORM 100-4

4.40 INVENTORY PROCEDURES

4.41 Purpose

The purpose of this element of the *Operations and Maintenance Manual* is to provide a record of the existing physical flood control system that is eligible for maintenance funding assistance by the District. The physical facilities that make up the collection and conveyance system have in many instances been paid for in whole or part by the District, however, they are not "owned" or operated, let alone maintained by the District. If, however, the total flood control system does not function properly when needed, it is ultimately the responsibility of the District to determine why and to take corrective action. A critical key to assuring the system functions properly is an up-to-date inventory of the physical system.

4.42 Physical System ~~Summary~~

In 1990, each agency ~~has~~ provided a list of measurable quantities that make up the flood control system in their jurisdiction. Facilities eligible are those identified in the Regional Flood Control District's Master Plan and any revisions, amendments, and/or changes subsequently approved. Only those facilities that exist as Master Plan facilities, or exist in the same alignment as a proposed Master Plan facility and appurtenant facilities are eligible.

~~Clark County~~
~~Las Vegas~~
~~North Las Vegas~~
~~Henderson~~
~~Boulder City~~
~~Mesquite~~

~~This information is not totally complete, however, it does represent the available information at this time.~~

Schedule

The inventory work sheets must be expanded to represent a true and accurate accounting of facilities on the Master Plan and tributary (drainage) systems and updated as a part of the annual certification process.

Reporting

The Entities should submit annual updates of the physical system inventory on the form required by the District.

4.43 Physical System Maps

Each Entity must have a map that shows the physical system for drainage and flood control. This map should reflect that portion that is on the Master Plan and also that portion that is eligible for maintenance funding by the District. ~~There is currently not a uniform comprehensive drainage and flood control system map that reflects the current system. The most current record is shown on the "marked up" plates from the Comprehensive Master Plan included in Appendix B of this manual.~~

Schedule

The individual Entities should submit to the District updated maps annually, or more frequently as project completion dictates, reflecting the size, location and material elements of their drainage and flood control system. The update should show those systems that are eligible for Flood Control District funding under the categories shown in **Section 4.11** of this manual.

Reporting

The system update should be provided or maps provided by the District and be in a form that is readily reproducible.

NEVADA REVISED STATUTE - CHAPTER 543 CONTROL OF FLOODS

543.340 Meeting; quorum; written policies and procedures.

1. In addition to the requirements of NRS 543.330, the board may meet at such time or times and at such regular meeting place within the district as it determines by resolution.

2. Special meetings may be held on notice to each member of the board as often as, and at such place or places within the district as, the needs of the district require.

3. A majority of the members of the board constitutes a quorum at any meeting.

4. The board shall adopt written policies and procedures for administering the district and for operating and maintaining its projects and improvements.

UNIFORM REGULATIONS FOR THE CONTROL OF DRAINAGE

12.050 Construction/Operation/Maintenance

Construction, operation and maintenance of Master Plan facilities shall be the responsibility of the Lead Entity as described in ~~Section 11.012~~the most recent edition of the District's Policy and Procedures Manual and delineated in the interlocal ~~funding agreement~~contract between the District and Lead Entity. The District may also function as the Lead Entity for construction, operation and maintenance of Master Plan facilities.

The role of the District and Lead Entity in funding regular maintenance of the facility shall be established through the interlocal ~~agreement~~contract formed as part of the District's policies and procedures for facility funding. ~~An inspection of all Master Plan facilities shall be conducted at least annually. This inspection and immediate correction of any identified maintenance deficiencies shall be the responsibility of the Lead Entity.~~Maintenance shall be performed in compliance with the most recent edition of the Operations and Maintenance Manual.

INTERLOCAL CONTRACT
ANNUAL MAINTENANCE WORK PROGRAM

THIS CONTRACT, made and entered into this ____ day of _____, ~~1990~~19____, by and between the ~~COUNTY OF CLARK~~[legal name of CITY or COUNTY], a political subdivision of the State of Nevada, hereinafter referred to as ~~"County"~~"CITY" (or "COUNTY"), and the CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT, hereinafter referred to as "DISTRICT".

W I T N E S S E T H:

WHEREAS, pursuant to Chapter 543 of the Nevada Revised Statutes, the DISTRICT may approve and fund projects to maintain flood control improvements; and

WHEREAS, the ~~County~~CITY (or COUNTY) desires to maintain flood control improvements ~~located on _____~~within the CITY (or COUNTY) in accordance with the maintenance program set forth herein, and hereinafter referred to as "Project"; and

WHEREAS, the ~~facility~~facilities upon which maintenance will be done ~~is a facility~~are facilities described in the DISTRICT's Master Plan.

NOW, THEREFORE, in consideration of the covenants, conditions, agreements, and promises of the parties hereto, the DISTRICT authorizes the Project as it is mutually understood and agreed as follows:

SECTION I - SCOPE OF PROJECT

This Interlocal Contract applies to the maintenance of flood control facilities, which are identified in the DISTRICT's Master Plan facilities including updates and amendments subsequently approved. The basic ~~improvements to the facility will be _____~~maintenance to the facilities will be in accordance with performance standards set forth in the current District *Operations and Maintenance Manual*.

The Project is more specifically described in Exhibit "A" which is attached hereto and by this reference incorporated herein.

SECTION II - PROJECT COSTS

The DISTRICT agrees to provide reimbursement for Project costs within the limits specified below:

1. The Projects costs shall not exceed $.

The amounts allocated to each individual facility within the Project must be specified in **Exhibit "A"**. Any changes to said allocated amounts must be approved by the DISTRICT's Chief Engineer in accordance with Section 4.24 of the District *Operations and Maintenance Manual*.

2. "Authorization to Proceed" is herein granted for maintenance of facilities in Exhibit "A" in an amount not to exceed _____, effective _____.

3. A separate request for an "Authorization to Proceed" will be required for additional facility maintenance funds.

4. A written request must be made to the DISTRICT and a Supplemental Interlocal Contract approved to increase the amount noted above prior to payment of any additional funds.

~~2~~5. The ~~County~~CITY (or COUNTY) and DISTRICT will comply with Section 4.12 of the Operation and Maintenance Manual. In accordance with said manual the ~~County~~CITY (or COUNTY) shall submit invoices together with a detailed summary report of the maintenance service performed. The ~~County~~CITY (or COUNTY) shall submit an invoice voucher ~~prepared in duplicate~~ in the manner prescribed by the DISTRICT. The vouchers shall include such information as is necessary for the DISTRICT to determine the nature of all expenditures. Each voucher will clearly indicate that it is for services rendered in performance under this contract. Each voucher will also be accompanied by a written certification from the ~~County~~CITY (or COUNTY) stating that it is for performance of maintenance activities under this contract and is composed of completed elements set forth in the annual work program.

All invoices must be submitted for payment to:

Clark County Regional Flood Control District
301 E. Clark Avenue, Suite ~~300~~301
Las Vegas, Nevada ~~89155~~89101
Attn: ~~Virginia Bax-Valentine~~
General Manager/Chief Engineer

Payment shall be considered timely if made by the DISTRICT within ~~45~~30 days. Pursuant to Section IV, Paragraph 6, the DISTRICT may, in its sole discretion, withhold payments to the ~~County~~CITY (or COUNTY) for services rendered if the ~~County~~CITY (or COUNTY) fails to satisfactorily comply with any term or condition of this contract and/or the DISTRICT *Operations and Maintenance Manual.*

SECTION III - PROJECT TIME

The ~~County~~CITY (or COUNTY) agrees to perform the Project to the satisfaction of the DISTRICT ~~prior to June 30, 1991~~on or before June 30, 19__. The DISTRICT may grant extensions or terminate this contract and require all sums advanced to the ~~County~~CITY (or COUNTY) to be repaid if the ~~County~~CITY (or COUNTY) fails to perform by said date.

SECTION IV - GENERAL

1. The ~~County~~CITY (or COUNTY) will complete the Project as set forth in **Exhibit "A"**. The ~~County~~CITY (or COUNTY) staff personnel responsible for coordination work under this contract are as listed below:

~~M.J. Manning, Director of Public Works~~
~~Michael O. Pullen, Deputy Director, Field Services~~
~~Richard J. Brennan, Manager, Maintenance Management Division~~
(list names and titles of CITY or COUNTY staff)

It is understood that staff named above will be responsible for work coordination throughout the period of this contract unless the DISTRICT is informed in writing of changes in these personnel assignments.

2. In addition to the specific terms set forth in this Contract, the parties hereto shall be subject to and governed by the District *Operations and Maintenance Manual*, and any applicable portions of the Policies and Procedures adopted by the DISTRICT.

3. It is the intent of the DISTRICT that scheduling of maintenance and repair of drainage and flood control facilities in general and Master Plan Facilities specifically be coordinated among entities. Therefore, in those cases where Master Plan approved, and District-funded projects have regional fund control significance impacting more than one entity, the ~~County~~CITY (or COUNTY) will allow all impacted entities an opportunity to review the maintenance schedule in order to coordinate maintenance efforts.

4. The Chief Engineer of the DISTRICT shall be responsible for monitoring the performance of the ~~County~~CITY (or COUNTY), approval for payment of billings and expenses submitted by the ~~County~~CITY (or COUNTY) and the acceptance of any report provided by the ~~County~~CITY (or COUNTY). The ~~County~~CITY (or COUNTY) shall be responsible for monitoring performance of ~~County~~CITY (or COUNTY) staff or private contractors, and the ~~County~~CITY (or COUNTY) shall maintain detailed records of all payments made to contractors and make such records available to the DISTRICT upon request.

5. The ~~County~~CITY (or COUNTY) shall provide right of access to its facilities to the DISTRICT or Chief Engineer at all reasonable times, in order to monitor and evaluate performance, compliance, and/or quality assurance under this contract.

6. In the event the ~~County~~CITY (or COUNTY) fails to perform the maintenance according to the standards specified in this contract and in the District *Operations and Maintenance Manual*, the DISTRICT may perform or cause to be performed the maintenance necessary to assure proper operation of the facility. Cost incurred by the DISTRICT shall be

reimbursed by the ~~County~~CITY (or COUNTY) or be deducted from the amount authorized by this contract. The DISTRICT may not exercise this right without giving the ~~County~~CITY (or COUNTY) specific written notice of the maintenance required and allowing the ~~County~~CITY (or COUNTY) 60 days within which to perform said maintenance. The notice required by this provision must be sent to:

~~MARTIN J. MANNING~~
~~Director~~
~~Department of Public Works~~
~~401 S. Fourth Street~~
~~Las Vegas, Nevada 89101~~
(insert name of City or County staff)
(insert title)
insert City or County mailing address)

7. The records of the ~~County~~CITY (or COUNTY) and/or private contractors pertaining to the subject matter of this contract shall at all reasonable times be subject to inspection and audit by the DISTRICT~~, County Auditor~~ or an Agent of the DISTRICT.

8. If any provision of this contract shall be deemed in conflict with any statute or rule of law, such provision shall be deemed modified to be in conformance with said statute or rule of law.

9. All parties to this contract shall comply with applicable local, state, and federal laws.

10. Any costs found to be improperly allocated in the Project will be refunded by the ~~County~~CITY (or COUNTY) to the DISTRICT.

11. It is specifically understood and agreed to by and between the parties hereto that it is not intended by any of the provisions of any part of this contract to create in the public or any member thereof a third party beneficiary hereunder, or to authorize anyone not a party to

this contract to maintain a suit for personal injuries or property damage pursuant to the terms or provisions of this contract.

12. The ~~County~~CITY (or COUNTY) hereby indemnifies and shall defend and hold harmless the DISTRICT, its representatives and their employees (or their authorized representatives) from and against any and all suits, actions, legal or administrative proceedings, claims, demands, damages, liabilities, interest, attorney's fees, costs and expenses whatsoever of any kind or nature whether arising before or after completion of the work hereunder and in any manner directly or indirectly caused, occasioned or contributed to in whole or in part, by reason of any act, omission, fault or negligence whether active or passive of the ~~County~~CITY (or COUNTY), of anyone acting under its direction or control, or on its behalf in connection with or incident to the performance of this Contract. The ~~County's~~CITY'S (or COUNTY'S) aforesaid indemnity and hold harmless obligations, or portions or applications thereof, shall apply to the fullest extent permitted by law, but in no event shall they apply to liability caused by the sole negligence or willful misconduct of the party indemnified or held harmless.

IN WITNESS WHEREOF, the parties have caused this contract to be executed the day and year first above written.

APPENDIX C
SAMPLE INTERLOCAL CONTRACT

~~EXAMPLE~~SAMPLE

INTERLOCAL CONTRACT
ANNUAL MAINTENANCE WORK PROGRAM

THIS CONTRACT, made and entered into this ____ day of _____, ~~1990~~19____, by and between the ~~COUNTY OF CLARK~~[legal name of CITY or COUNTY], a political subdivision of the State of Nevada, hereinafter referred to as ~~"County"~~"CITY" (or "COUNTY"), and the CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT, hereinafter referred to as "DISTRICT".

W I T N E S S E T H:

WHEREAS, pursuant to Chapter 543 of the Nevada Revised Statutes, the DISTRICT may approve and fund projects to maintain flood control improvements; and

WHEREAS, the ~~County~~CITY (or COUNTY) desires to maintain flood control improvements ~~located on _____~~within the CITY (or COUNTY) in accordance with the maintenance program set forth herein, and hereinafter referred to as "Project"; and

WHEREAS, the ~~facility~~facilities upon which maintenance will be done ~~is a facility~~are facilities described in the DISTRICT's Master Plan.

NOW, THEREFORE, in consideration of the covenants, conditions, agreements, and promises of the parties hereto, the DISTRICT authorizes the Project as it is mutually understood and agreed as follows:

SECTION I - SCOPE OF PROJECT

This Interlocal Contract applies to the maintenance of flood control facilities, which are identified in the DISTRICT's Master Plan facilities including updates and amendments subsequently approved. The basic ~~improvements to the facility will be _____~~maintenance to the facilities will be in accordance with performance standards set forth in the current District *Operations and Maintenance Manual*.

The Project is more specifically described in Exhibit "A" which is attached hereto and by this reference incorporated herein.

SECTION II - PROJECT COSTS

The DISTRICT agrees to provide reimbursement for Project costs within the limits specified below:

1. The Projects costs shall not exceed $_____.

The amounts allocated to each individual facility within the Project must be specified in **Exhibit "A"**. Any changes to said allocated amounts must be approved by the DISTRICT's Chief Engineer in accordance with **Section 4.24** of the District *Operations and Maintenance Manual.*.

A written request must be made to the DISTRICT and a Supplemental Interlocal Contract approved to increase the amount noted above prior to payment of any additional funds.

2. The ~~County~~CITY (or COUNTY) and DISTRICT will comply with Section 4.12 of the Operation and Maintenance Manual. In accordance with said manual the ~~County~~CITY (or COUNTY) shall submit invoices together with a detailed summary report of the maintenance service performed. The ~~County~~CITY (or COUNTY) shall submit an invoice voucher ~~prepared in duplicate~~ in the manner prescribed by the DISTRICT. The vouchers shall include such

information as is necessary for the DISTRICT to determine the nature of all expenditures. Each voucher will clearly indicate that it is for services rendered in performance under this contract. Each voucher will also be accompanied by a written certification from the ~~County~~CITY (or COUNTY) stating that it is for performance of maintenance activities under this contract and is composed of completed elements set forth in the annual work program.

All invoices must be submitted for payment to:

Clark County Regional Flood Control District
301 E. Clark Avenue, Suite ~~300~~301
Las Vegas, Nevada ~~89155~~89101
Attn: ~~Virginia Bax-Valentine~~General Manager/Chief Engineer

Payment shall be considered timely if made by the DISTRICT within ~~45~~30 days. Pursuant to Section IV, Paragraph 6, the DISTRICT may, in its sole discretion, withhold payments to the ~~County~~CITY (or COUNTY) for services rendered if the ~~County~~CITY (or COUNTY) fails to satisfactorily comply with any term or condition of this contract and/or the DISTRICT *Operations and Maintenance Manual.*

SECTION III - PROJECT TIME

The ~~County~~CITY (or COUNTY) agrees to perform the Project to the satisfaction of the DISTRICT ~~prior to June 30, 1991~~on or before June 30, 19__. The DISTRICT may grant extensions or terminate this contract and require all sums advanced to the ~~County~~CITY (or COUNTY) to be repaid if the ~~County~~CITY (or COUNTY) fails to perform by said date.

SECTION IV - GENERAL

1. The ~~County~~CITY (or COUNTY) will complete the Project as set forth in **Exhibit "A"**. The ~~County~~CITY (or COUNTY) staff personnel responsible for coordination work under this contract are as listed below:

~~M.J. Manning, Director of Public Works~~
~~Michael O. Pullen, Deputy Director, Field Services~~
~~Richard J. Brennan, Manager, Maintenance Management Division~~
(list names and titles of CITY or COUNTY staff)

It is understood that staff named above will be responsible for work coordination throughout the period of this contract unless the DISTRICT is informed in writing of changes in these personnel assignments.

2. In addition to the specific terms set forth in this Contract, the parties hereto shall be subject to and governed by the District *Operations and Maintenance Manual*, and any applicable portions of the Policies and Procedures adopted by the DISTRICT.

3. It is the intent of the DISTRICT that scheduling of maintenance and repair of drainage and flood control facilities in general and Master Plan Facilities specifically be coordinated among entities. Therefore, in those cases where Master Plan approved, and District-funded projects have regional fund control significance impacting more than one entity, the ~~County~~CITY (or COUNTY) will allow all impacted entities an opportunity to review the maintenance schedule in order to coordinate maintenance efforts.

4. The Chief Engineer of the DISTRICT shall be responsible for monitoring the performance of the ~~County~~CITY (or COUNTY), approval for payment of billings and expenses submitted by the ~~County~~CITY (or COUNTY) and the acceptance of any report provided by the

~~County~~CITY (or COUNTY). The ~~County~~CITY (or COUNTY) shall be responsible for monitoring performance of ~~County~~CITY (or COUNTY) staff or private contractors, and the ~~County~~CITY (or COUNTY) shall maintain detailed records of all payments made to contractors and make such records available to the DISTRICT upon request.

5. The ~~County~~CITY (or COUNTY) shall provide right of access to its facilities to the DISTRICT or Chief Engineer at all reasonable times, in order to monitor and evaluate performance, compliance, and/or quality assurance under this contract.

6. In the event the ~~County~~CITY (or COUNTY) fails to perform the maintenance according to the standards specified in this contract and in the District *Operations and Maintenance Manual,* the DISTRICT may perform or cause to be performed the maintenance necessary to assure proper operation of the facility. Cost incurred by the DISTRICT shall be reimbursed by the ~~County~~CITY (or COUNTY) or be deducted from the amount authorized by this contract. The DISTRICT may not exercise this right without giving the ~~County~~CITY (or COUNTY) specific written notice of the maintenance required and allowing the ~~County~~CITY (or COUNTY) 60 days within which to perform said maintenance. The notice required by this provision must be sent to:

~~MARTIN J. MANNING~~
~~Director~~
~~Department of Public Works~~
~~401 S. Fourth Street~~
~~Las Vegas, Nevada 89101~~
(insert name of City or County staff)
(insert title)
(insert City or County mailing address)

7. The records of the ~~County~~CITY (or COUNTY) and/or private contractors pertaining to the subject matter of this contract shall at all reasonable times be subject to inspection and audit by the DISTRICT~~, County Auditor~~ or an Agent of the DISTRICT.

8. If any provision of this contract shall be deemed in conflict with any statute or rule of law, such provision shall be deemed modified to be in conformance with said statute or rule of law.

9. All parties to this contract shall comply with applicable local, state, and federal laws.

10. Any costs found to be improperly allocated in the Project will be refunded by the ~~County~~CITY (or COUNTY) to the DISTRICT.

11. It is specifically understood and agreed to by and between the parties hereto that it is not intended by any of the provisions of any part of this contract to create in the public or any member thereof a third party beneficiary hereunder, or to authorize anyone not a party to this contract to maintain a suit for personal injuries or property damage pursuant to the terms or provisions of this contract.

12. The ~~County~~CITY (or COUNTY) hereby indemnifies and shall defend and hold harmless the DISTRICT, its representatives and their employees (or their authorized representatives) from and against any and all suits, actions, legal or administrative proceedings, claims, demands, damages, liabilities, interest, attorney's fees, costs and expenses whatsoever of any kind or nature whether arising before or after completion of the work hereunder and in any manner directly or indirectly caused, occasioned or contributed to in whole or in part, by reason of any act, omission, fault or negligence whether active or passive of the ~~County~~CITY (or COUNTY), of anyone acting under its direction or control, or on its behalf in connection

with or incident to the performance of this Contract. The ~~County's~~CITY'S (or COUNTY'S) aforesaid indemnity and hold harmless obligations, or portions or applications thereof, shall apply to the fullest extent permitted by law, but in no event shall they apply to liability caused by the sole negligence or willful misconduct of the party indemnified or held harmless.

IN WITNESS WHEREOF, the parties have caused this contract to be executed the day and year first above written.

ANNUAL MAINTENANCE WORK PLAN SUMMARY

PART I

Summary of overall work plan listing specific projects and associated costs attributable to each.

PART II

Facility map(s) which identify location of planned maintenance work by project.

PART III

Summary of work plan broken into maintenance activities to be completed, with associated costs, for all projects identified in Part I.

~~Exhibit B~~

~~GENERAL TERMS AND CONDITIONS~~

~~DEFINITIONS -- As used throughout the contract, the following terms shall have the meaning set forth below:~~

~~A. "DISTRICT" shall mean the Clark County Regional Flood Control DISTRICT.~~

~~B. "Certification" shall mean the documentation which evidences that a maintenance activity by an Entity has been completed in accordance with established standards.~~

~~C. "Chief Engineer" shall mean the Chief Engineer and General Manager of the DISTRICT or authorized agent as delineated in NRS 543.510.~~

~~D. "Entity" shall mean the singular reference to either the county or one of the incorporated cities within the DISTRICT.~~

~~E. "Master Plan" shall mean the most recent edition of the Flood Control Master Plan adopted by the Board and Entities.~~

~~F. "Regional Fund" shall mean the monies described in NRS 543.595(2) and managed by the DISTRICT for funding of maintenance activities on flood control facilities identified in the Master Plan.~~

~~ENTITY NOT EMPLOYEE OF THE DISTRICT -- The Lead Entity and its employees or agents performing under this contract are not employees or agents of the DISTRICT. The Lead Entity will not hold itself out as nor claim to be an employee of the DISTRICT by reason hereof.~~

~~COMPLIANCE -- During the performance of this contract, the Lead Entity shall comply with all applicable local, federal and state regulations.~~

~~INDEMNIFICATION - The Lead Entity shall defend, protect and hold harmless the DISTRICT, or any employees thereof, from and against all claims, suits or actions arising from the Lead Entity's acts which are libelous or slanderous, result in injury to persons or property, violate a right of confidentiality, or use or reproduce material of any kind which constitutes an infringement of any copyright, patent, trademark or tradename.~~

~~TREATMENT OF ASSETS~~

~~A. Any property of the DISTRICT furnished to the Lead Entity shall, unless otherwise provided herein or approved by the DISTRICT, be used only for the performance of this contract.~~

B. The Lead Entity shall be responsible for any loss or damage to property of the DISTRICT which results from the negligence of the Lead Entity or which results from the failure on the part of the Lead Entity to maintain and administer that property in accordance with sound management practices.

C. Upon loss or destruction of, or damage to, any DISTRICT property, the Lead Entity shall notify the DISTRICT thereof and shall take all reasonable steps to protect that property from further damage.

D. The Lead Entity shall surrender to the DISTRICT all property of the DISTRICT prior to completion, termination or cancellation of this contract.

E. All reference to the Lead Entity under this clause shall also include Lead Entity's employees, agents, or subcontractors.

NONASSIGNABILITY - Neither this contract, nor any claim arising under this contract, shall be transferred or assigned by the Lead Entity without the written authorization of the DISTRICT.

RECORDS, DOCUMENTS, AND REPORTS - The Lead Entity shall maintain books, records, documents and other evidence of accounting procedures and practices which sufficiently and properly reflect all direct and indirect costs of any nature expended in the performance of maintenance activity under this contract. These records shall be subject at all reasonable times to inspection, review, or audit by personnel duly authorized by law, rule, regulation, or contract. The Lead Entity will retain all books, records, documents, and other materials relevant to this contract for three years after completion of the contract, and make them available for inspection by persons authorized under this contract.

RIGHT OF INSPECTION - The Lead Entity shall provide right of access to its facilities to the DISTRICT or Chief Engineer at all reasonable times, in order to monitor and evaluate performance, compliance, and/or quality assurance under this contract.

LICENSING, ACCREDITATION AND REGISTRATION - The Lead Entity shall comply with all applicable local, state and federal licensing, accreditation and registration requirements/standards, necessary for the performance of this contract.

ADVANCE PAYMENTS PROHIBITED - No payment in advance or in anticipation of services or supplies to be provided under this contract shall be made by the DISTRICT.

LIMITATION OF AUTHORITY - Only the DISTRICT shall have the express, implied, or apparent authority to alter, amend, modify, or waive any clause or condition of this contract. Any alteration, amendment, modification, or waiver of any clause or condition of this contract is not effective or binding unless made in writing and signed by the DISTRICT.

~~WAIVER OF DEFAULT -- Waiver of any default shall not be deemed to be a waiver of any subsequent default. Waiver of breach of any provision of the contract shall not be deemed to be a waiver of any other or subsequent breach and shall not be construed to be a modification of the terms of the contract unless stated to be such in writing, signed by the DISTRICT and attached to the original contract.~~

~~CHANGES AND MODIFICATIONS -- The DISTRICT may, at any time, by written notification to the Lead Entity and without notice to any known guarantor or surety, make changes in the general scope of the services to be performed under this contract. If any such changes cause an increase or decrease in the cost of, or the time required for the performance of this contract, an equitable adjustment may be made in the contract price or period of performance, or both, and the contract shall be modified in writing accordingly. Any claim by the Lead Entity for adjustment under this clause must be asserted within 10 days from the date of the Lead Entity's receipt of the notice of such change; Provided, however, that the DISTRICT may, upon determining that the facts justify such action, receive and act upon such claim asserted at any time prior to final payment under this contract. Failure to agree to any adjustment shall be a dispute concerning a question of fact within the meaning of the clause of this contract entitled "Disputes". However, nothing in this clause shall excuse the Lead Entity from proceeding with the contract as changed.~~

~~DISPUTES -- Except as otherwise provided in this contract, when a bona fide dispute arises between the DISTRICT and the Lead Entity and it cannot be resolved, either party may request a dispute hearing before the DISTRICT. Such a request for review must be in writing and clearly state:~~

~~1. the disputed issue(s), and~~
~~2. the relative positions of the parties.~~

~~These requests must be mailed to the DISTRICT in care of the Chief Engineer. The parties agree that this dispute process shall precede any action in a judicial or quasi-judicial tribunal.~~

~~TERMINATION FOR DEFAULT -- By written notice the DISTRICT may terminate the contract, in whole or in part, for failure of the Lead Entity to perform any of the provisions hereof.~~

~~UNCONTROLLABLE FORCES -- Neither Party shall be considered to be in default in the performance of any of the agreements contained in this Contract, except for obligations to pay money, when and to the extent failure of performance shall be caused by an uncontrollable force. If either Party because of an uncontrollable force is rendered wholly or partly unable to perform its obligations under the Contract, the Party shall be excused from whatever performance is affected by the uncontrollable force to the extent so affected provided that:~~

~~1. the nonperforming Party, within two weeks after the occurrence of the uncontrollable force, gives the other Party written notice describing the particulars of the occurrence,~~

2. the suspension of performance is of no greater scope and of no longer duration than is required by the uncontrollable force;

3. the nonperforming Party uses its best efforts to remedy its inability to perform (this subsection shall not require the settlement of any strike, walkout, lockout or other labor dispute on terms which, in the sole judgment of the Party involved in the dispute, are contrary to its interest. It is understood and agreed that the settlement of strikes, walkouts, lockouts or other labor disputes shall be at the sole discretion of the Party having the difficulty);

4. when the nonperforming Party is able to resume performance of its obligations under this Contract, that Party shall give the other Party written notice to that effect.

In the event that either Party's ability to perform cannot be corrected when the uncontrollable force is caused by the actions or inactions of legislative, judicial or regulatory agencies or other proper authority, this Contract may be amended to comply with the legal or regulatory change which caused the nonperformance.

TERMINATION PROCEDURE - After receipt of a notice of termination, and except as otherwise directed by the DISTRICT, the Lead Entity shall:

1. Stop work under the contract on the date, and to the extent specified, in the notice;

2. Place no further orders or contracts for materials, services, or facilities except as may be necessary for completion of such portion of the work under the contract as is not terminated;

3. Settle all outstanding liabilities and all claims arising out of such termination of orders and subcontracts, with the approval or ratification of the DISTRICT to the extent DISTRICT may require, which approval or ratification shall be final for all purposes of this clause;

4. Complete performance of such part of the work as shall not have been terminated by the DISTRICT; and

5. Take such action as may be necessary, or as the DISTRICT may direct, for the protection and preservation of the property related to this contract which is in the possession of the Lead Entity and in which the DISTRICT has or may acquire an interest.

GOVERNING LAW - This contract shall be governed by the laws of the State of Nevada. The Lead Entity, by execution of this contract, acknowledges the jurisdiction of the courts of the State of Nevada in this matter.

300 East Clark Avenue, Suite 301
Las Vegas, Nevada 89101

Dear Mr. Fraser:

SLOAN CHANNEL IMPROVEMENTS, CONFLUENCE DETENTION BASIN AND APPURTENANT COLLECTION AND DISCHARGE FACILITIES - FINAL PREDESIGN MEMORANDUM SUBMITTAL

For your review and comments please find enclosed a Final Predesign Memorandum for the Range Wash Confluence Detention Basin and Sloan Channel Improvements. Also enclosed for your perusal and file are copies of the Draft Predesign Memorandum comments and Boyle Engineering's response.

Kindly be advised that a meeting is scheduled for all interested parties on Tuesday, October 27, 1992 at 1:30 pm in the Clark County Regional Flood Control District conference room at the "District" office, 300 East Clark Avenue, Suite 301. This meeting will entertain comments, suggestions, and recommendations relative to this Final Predesign Memorandum submitted by Boyle Engineering Corporation on October 16, 1992.

Kindly be present or arrange to be represented for participation in discussion of any comments or concerns regarding these improvements. In addition to attendance at this meeting, we encourage written comments either prior to or for distribution and resolution at this meeting.

COMMISSIONERS
Jay Bingham, Chairman • Karen Hayes, Vice-Chairman
Paul J. Christensen, Thalia M. Dondero, William U. Pearson, Don Schlesinger, Bruce L. Woodbury
Donald L. "Pat" Shalmy, County Manager

Should there be questions, please call me at 455-7707.

Re: Confluence Detention Basin

Dear Mr. Brandt:

Transmitted herewith are 25 copies of the Final Predesign Memorandum for the *Confluence Detention Basin and Sloan Channel Improvements*.

Summarized below is Boyle Engineering Corporation's (Boyle's) response to the Draft Predesign Memorandum comments received from the Clark County Public Works Department (County) on October 8, 1992.

Section I - Clark County Regional Flood Control District (CCRFCD) Comments

1) The directional references have been corrected in the text.

2) The project location indicated on Figure 1 has been corrected.

3) a) Additional text has been added to Section 2.B. of the memorandum to indicate the need for a Section 14 Site Specific Analysis in accordance with the CCRFCD's Environmental Impact Statement, to be performed concurrently with the design phase of the project.

3) b) Additional text has been added to Section 2.B. of the memorandum to include the CCRFCD's comment that no further paleontological work should be required.

3) c) Additional text has been added to Section 2.B. of the memorandum to include the CCRFCD's comments regarding the mitigation measures to protect the desert tortoise.

.....Continued

4) Inflow and outflow hydrographs, stage/storage/discharge curves and calculations have been added to the memorandum as Appendix E. This data, however, is preliminary and will change in final design. Diversion to the basin, grading plan, and outlet conditions have not been finalized.

The 84-inch outlet pipe indicated in the HEC-1 model was a text error resulting from not changing the comment from a previous model run. The stage discharge data in the model, however, correctly corresponded to the 5' x 3' RCB outlets indicated in the text and figures of the memorandum.

5) An additional HEC-1 model without the East Range Wash Detention Basin was executed. However, stage/storage/discharge data is only preliminary and the impact of omitting the upstream basin cannot be accurately determined at this time. The model used fully developed conditions, but without the upstream detention basin. The results indicated the maximum stage increased by .48 feet, still below the spillway in the preliminary model. The maximum storage increased by 68 acre-feet.

6) Refinements in the design phase of the project will focus on further limiting the construction costs.

Section II - County Comments

1. Toiyabe Street at this location is a low-speed, low-volume residential street, therefore, a guardrail should not be required.

2. The directional references have been corrected.

3. Converse Consultants Southwest, Inc. (Converse) has done further evaluation of impacts to groundwater and determined criteria to avoid negative impacts. A letter from Converse on this subject has been added to Appendix B, as well as additional text to Section 3.B. of the memorandum. The Section 14 Site Specific Analysis will also address this issue.

4. Alternative 2 is a more favorable alternative in terms of maintenance, as well as other considerations. Additional text in regard to maintenance differences and costs have been added to Section 5.E. and 10. of the memorandum.

5. The directional reference has been corrected.

.....Continued

6. Figure 9 has been changed to indicate a conceptual design of a diversion structure to split flows.

7. Cut-off walls will be used to protect structures and, as shown in Figure 18, to protect the channel lining of the outlet channel.

8. Clarifications have been made to Figure 15.

9. Erosion and bank protection will be provided at the location of major inflows into the golf course channel. Additional text has been added to Section 5.D.

10. Additional text has been added to Section 10, relating to cost comparisons of alternative materials.

11. Figure 19 has been modified to indicate Nellis Air Force Base, private, and public lands.

12. Land costs have been reviewed and additional text has been added to Section 10 for clarification.

13. The final design memorandum is a report which utilized engineering analysis and was stamped and sealed by the preparer.

Boyle has appreciated the opportunity to work with the County on this project and is eager to proceed with the design phase of the project, upon notification from the County.

Very truly yours,

Dear Mr. Davis:

SLOAN CHANNEL IMPROVEMENTS, CONFLUENCE DETENTION BASIN AND APPURTENANT COLLECTION AND DISCHARGE FACILITIES - DRAFT PREDESIGN MEMORANDUM COMMENTS

We are herewith forwarding a marked-up copy of the "Draft Predesign Memorandum" for Sloan Channel Improvements, Confluence Detention Basin and Discharge Facilities submitted by Boyle Consulting Engineers on August 6, 1992.

In addition to the marked-up document, we are tendering the following general comments for your perusal and incorporation with the Final Predesign Memorandum.

I. REGIONAL FLOOD CONTROL DISTRICT

Please refer to the attached letter copy for pertinent concerns.

II. CLARK COUNTY DEPARTMENT OF PUBLIC WORKS

1. The section of Toiyabe Street that will be located adjacent to the outlet channel needs to be evaluated for guardrail placement. The "Roadside Design Guide" by AASHTO is to be used to establish guardrail installation criteria. From the preliminary report, a guardrail installation seems mandatory.

2. On page 1, A. Background, under subparagraph 2) the west should read: "just east of the NAFB Golf Course."

COMMISSIONERS
Jay Bingham, Chairman • Karen Hayes, Vice-Chairman
Paul J. Christensen, Dunlin M. Doubleo, William U. Pearson, Don Schlesinger, Bruce L. Woodbury
Donald L. "Pat" Sunday, County Manager

3. Converse Environmental Consultants Southwest had expressed concern as to leachate from landfills impacting low and downstream areas. A question of actual effect and possible containment must be resolved in this regard, as concluded in the environmental report. It should be recognized that a Section 14 (EIS Report) analysis must be performed to "clear" the area(s) of concern.

4. It was discussed and agreed that probably the optimum route to pursue, subject to issuance of the Final Predesign Memorandum (FPM) and authorization to proceed by the Director, would be Alternative 2.

   Annualized maintenance costs must be submitted in the FPM to compare Alternates 1 & 2.

5. On page 9, we again have the Confluence Basin indicated as being west of the NAFB Golf Course when it should be "east".

6. Figure 9 should indicate the relationship of a control structure (Alt. 2 as recommended by Boyle Engineering) to the redesigned roadway.

7. The Draft Predesign Memorandum does not indicate use of cut-off walls.

8. Figure 15 should indicate direction of flow and incorporate elevations where applicable.

9. Consideration should be given to handling flow into the Confluence Basin from the "major drainage route" carrying water from runways as shown on Fig. 20.

10. Due to monetary constraints, a comparison of alternative construction methods must be included in the FPM; e.g. soil cement vs. roller compacted concrete, etc.

11. Fig. 19 should be modified to indicate NAFB property, private land, and public lands.

12. Tables 2 and 3 utilize a $ 10,000.00 per acre land acquisition cost. This figure appears to be somewhat low; please review.

13. Note that the Nevada State Board of Registered Professional Engineers and Land Surveyors has taken the position (see attached) that preliminary submittals should be stamped but not signed. Please submit the FPM with a seal (not signed or dated) representing the engineer in responsible charge of work.

Kindly address issues raised and submit a FPM prior to receiving authorization on actual design work (Contract Section 2.03).

Should there be questions or if you require any additional information, feel free to call me at 455-7707.

Range Wash Confluence Detention Basin and Sloan Channel
Draft Predesign Memorandum

Dear Mr. Brandt:

After review of the Draft predesign memorandum for the referenced project, the following comments are offered for your consideration:

1) It seems that the directional references in items 1 and 2 of section 1.A should be reversed;

2) The project location appears to be incorrect on Figure 1;

3) With respect to the statements regarding environmental issues, the following are noted:

   a) The environmental regulations and mitigations which apply to this project are outlined in the District's EIS and Record of Decision (ROD), whether on public or private lands. In accordance with the stipulations of the ROD, as project specific elements become available through final design, further environmental documentation must be performed as outlined in Section 14 of the EIS. Where no public lands are involved the District is charged with administering the site specific analyses (Section 14) and mitigation measures required by the EIS. A Section 14 analysis will be require for this project and should be coordinated with and submitted to the District.

   b) The paleontological assessment for the District's master plan has been completed and accepted by the Bureau of Land Management (BLM). A copy of the assessment can be obtained from the District upon request. The assessment does not identify the project area as one of concern; therefore, no further paleontological work should be required.

   c) Mitigation measures to protect the existence of the desert tortoise will

301 E. Clark Avenue, Suite 301 • Las Vegas, Nevada 89101
(702) 455-3139 • FAX: (702) 455-3870

be in accordance with the District's biological opinion (Opinion) as amended. Recent amendments to the Opinion have revised mitigation measures to be consistent with those required by the Habitat Conservation Program (HCP). Temporary tortoise proof fencing will not be required. Mitigation fees for the loss of tortoise habitat have already been paid by the District for this and other projects. It should be clear that the HCP does not apply to this project.

4) Stage/storage and stage/discharge curves and calculations should be included to support the values used in the hydrologic model. The HEC-1 models refer to the outlet structure as an 84" RCP, while the plans show a multiple cell 5' X 3' RCB. Inflow and outflow hydrographs should be included.

5) It may be prudent to execute one additional HEC-1 model to simulate the basin function in the absence of the East Range Wash Detention Basin (RWEA 0625, F-7&8).

6) The preliminary cost estimates for alternatives 1 and 2 are $10,194,500 and $9,387,500, respectively. It should be noted that $8,620,000 is programmed on the Bond Project List for this project.

If you should have any questions or if I can be of any assistance, please give me a call.

Dear Mr. Brandt:

This firm represents the Nevada State Board of Registered Professional Engineers and Land Surveyors which has requested this firm to respond to your letter of May 1, 1990. The Board has devoted a great deal of effort and time on the issue of stamping and sealing of documents, specifications, plats and reports submitted to public entities. The Board is in the process of preparing a regulation that will detail the procedures to be followed in the stamping and sealing of such documents.

The Board will solicit the input of its registrants and the building officials prior to the enactment of the regulation. However, the Board's position on the issues raised in your letter of May 1, 1990 now stands as follows:

1. Preliminary items should be stamped and noted as preliminary and not for construction. The stamp should not be signed. It is stamped solely to identify the professional who prepared the preliminary plan.

2. The Board discourages the submittal of final plans to a developer. The Board prefers that the professional be responsible for the delivery of the final stamped plans to the public entity. However, the public entity should in all cases require final plans to be stamped and signed by the professional irrespective of whether the plans are submitted by the professional or by a developer.

The Board looks forward to working with you in the drafting of the forth coming regulation. Your further input would be greatly appreciated.

Sincerely,

BRUCE ROBB

Dear Mr. Fraser:

RANGE WASH - SLOAN CHANNEL CONFLUENCE BASIN

Subsequent to our December 10, 1992 meeting, the State Of Nevada, Division of Water Resources (DWR), has accepted Boyle Engineering's design concept for the Confluence Basin.

For your perusal and file, you will find enclosed copies of Boyle Engineering's 12/14/92 letter conveying the above information, together with the 11/24/92 spillway concept letter to DWR and their Confluence Detention Basin Design Memo.

Recognizing initial tacit acceptance of the Boyle Engineering spillway concept by DWR and coupling that with apparent cost savings from utilizing the modified Alternate 2 - two stage discharge, it appears we should now actively pursue design and forego additional spillway evaluations.

Please review the enclosed material and advise your thoughts at the earliest, possible convenience. We, of course, would prefer to avoid the propensity for design delays, additional engineering costs and supplemental DWR review if substantive benefits cannot be determined beforehand.

Re: Confluence Detention Basin

Transmitted herewith is a copy of minutes to the meeting held at the Clark County Regional Flood Control District (District) on December 10, 1992.

Boyle has been delayed in design due to the time which transpired to coordinate with the District and resolve the issues regarding the requirements of the PMF pool elevation and land acquisition. There has also been delay regarding acceptance of the diversion and two-level outlet system. These issues were discussed in a meeting held at Clark County Public Works Department (County) on November 13, 1992. The meeting of December 10, 1992 resolved these issues, as indicated in the attached minutes, after approximately four weeks have transpired..

Subsequent to the meeting, Boyle Engineering Corporation (Boyle) received notification from the State Engineer, Division of Water Resources, that there are no objections to the spillway concept which was presented in the letter of November 24, 1992. A copy of the letter from the Division of Water Resources is enclosed.

The spillway concept presented is an economical solution and has now been determined acceptable by the Division of Water Resources. As noted in the attached meeting minutes, Boyle has been requested to evaluate additional spillway concepts, particularly, using the entire west embankment length for a spillway. The additional evaluation and the associated review and comments may cause additional delays to our schedule.

If spillway concepts can be resolved quickly, Boyle expects to make the 60 percent design submittal three weeks behind the previously submitted schedule, on February 1, 1993. Delayed acceptance of a spillway length alternative by the District or the County would further delay the date of the submittal.

Please contact Boyle if there are any additional comments or revisions to the minutes.

BOYLE ENGINEERING CORPORATION

Donald W. Davis, PE
Senior Civil Engineer

enclosure

cc: Gale Fraser, Clark County Regional Flood Control District

MINUTES OF MEETING
CONFLUENCE DETENTION BASIN

December 10, 1992

Attendees:

Bill Brandt, Clark County Public Works
Gale Fraser, Clark County Regional Flood Control District
Kevin Eubanks, Clark County Regional Flood Control District
Don Davis, Boyle Engineering Corporation

Summary:

1. The proposed diversion and two-level outlet concept to reduce detention basin storage requirements, presented in the design memo transmitted on November 30, 1992, was accepted. However, more calculations and refinement related to the function of the outlet structure needs to be performed and provided.

2. The District indicated that land would need to be acquired up to the elevation of the dam embankment or the PMF pool, whichever is higher, from the properties on the east side of the Detention Basin. The low elevation areas to the north and west, primarily Nellis Air Force Base property, would not have to be acquired to this elevation since there are no reasonable means to protect this area from the PMF.

3. The spillway concept and letter sent to the State Engineer was discussed, wherein some of the flows of the PMF back up into the golf course area and flow around the detention basin. The State Engineer had not yet responded to the letter.

4. The District proposed that the spillway be increased to the full length of the dam embankment on the west side. This would resolve some concerns about the presently proposed spillway not passing the entire PMF amount. It would reduce the height of the dam embankment by approximately one foot, and reduce the land acquisition requirements on the east side of the basin. The flow which would back up and flow around the basin through the golf course would be assumed to be non-effective flow. Since some flows are likely to bypass the basin, the District would be satisfied with no freeboard above the calculated PMF pool elevation. The amount of freeboard required will need to be discussed with, and meet the requirements of, the State Engineer.

5. The District requested that, in conjunction with geotechnical findings and recommendations, additional evaluation of cross-section, length, cost, and materials of spillway alternatives be performed.

Re: Confluence Detention Basin

Transmitted herewith are the following items:

2 copies — *Confluence Detention Basin Memo*. This memo explains revised hydrology and proposed design changes.

2 copies — Letter to State of Nevada Department of Conservation and Natural Resources. This letter is in regard to the proposed spillway concept.

1 copy — Legal description and parcel maps for the following parcels:

260-290-002	260-290-003	260-290-017
260-290-009	260-290-010	260-290-013
260-290-023	260-290-024	260-290-025
260-290-022		

1 copy — Stamped legal description for channel easement through golf course and accompanying exhibit.

Please forward a copy of the design memo and letter to State of Nevada to Mr Denis Cederburg. Copies of these two items have been sent direct to the Clark County Regional Flood Control District per your request.

Boyle is presently assuming that the land affected by the Probable Maximum Flood (PMF) pool will not be required to be obtained. Please notify us as soon as possible to resolve and clarify the requirements regarding the PMF.

Please call if you have any questions regarding the items transmitted.

CONFLUENCE DETENTION BASIN
DESIGN MEMO

INTRODUCTION

Boyle Engineering Corporation (Boyle) has prepared this memo to explain required changes in hydrology and proposed changes to the design of facilities for the *Confluence Detention Basin and Sloan Channel Improvements.*

REVISED HYDROLOGY

The hydrologic model used for the Predesign Memorandum Confluence Detention Basin and Sloan Channel Improvements was originally developed for the Western and Eastern Tributaries of Range Wash Flood Control Facility Plan. The model was developed in accordance with the directions of The Clark County Regional Flood Control District (CCRFCD). After the model was initially developed, the CCRFCD directed it to be calibrated to meet the accepted flow, at the confluence with the Las Vegas Wash, established by the U. S. Army Corps of Engineers (COE). The calibration was achieved by using factored Soil Conservation Service (SCS) curve numbers corresponding to an Antecedent Moisture Condition (AMC) of 1.8. The depth area reduction factors applied to point precipitation values were taken from HYDRO-40 per the direction of CCRFCD at that time. This hydrologic model was developed prior to the acceptance of the Clark County Regional Flood Control District Hydrologic Criteria and Drainage Design Manual (CCRFCD Manual). The current project requires conformance with the CCRFCD Manual. The new criteria uses a depth area reduction factors developed by the COE, which have a greater reduction in average rainfall over larger areas. The manual also indicates that curve numbers associated with an AMC 2 (average) be utilized. Table 1 indicates the resulting changes in SCS CN values. The differences in depth area reduction are shown in Table 2.

Revising the model to conform with the present criteria results in similar flows at the Las Vegas Wash. This is because the new curve numbers increase the amount of runoff, but the new depth area reduction factors reduce the average rainfall. However, the new criteria produces higher flows and greater volumes for upstream and smaller areas.

For the Alternative 2 conditions presented in the Predesign Memorandum, the revised hydrology increases the calculated peak storage volume by approximately 150 acre-feet.

A storm located below the detention basin (Area E only) produces a flow at the Las Vegas Wash of approximately 3,600 cfs, approximately 400 cfs more than the previous model produced. Since downstream Sloan Channel requirements will be 3,600 cfs

based on the Area E Storm, and existing lined portions of Sloan Channel have sufficient capacity, the target discharge for an area wide storm (BCDE) including detention basin outflow may be increased to 3,600 cfs at the Las Vegas Wash.

TWO LEVEL OUTLET

As discussed in progress meetings the storage requirements of the detention basin may be reduced if a two level outlet is utilized. A greater amount of flow may bypass the detention basin in the existing Sloan Channel if the flow released from the detention basin is relatively low. The combined flow of the Sloan Channel Bypass and the Detention Basin Outflow added to the downstream flows should not produce a peak discharge greater than 3,600 cfs at the Las Vegas Wash. After the peak flow generated from the downstream area passes, the flow released from the detention basin may be increased. Thus the hydrograph generated from the downstream area is dropping, while the detention basin outflow hydrograph is rising, and the net discharge remains below 3,600 cfs.

The release rate from the detention basin outflow may be increased by means of a secondary outlet, which begins to operate after the detention basin has filled to a higher level. The initial low level outlet will have an orifice control with invert elevation at 1799. The higher level outlet may be accomplished by a large box structure into which the low level outlet also enters. The top of the box will form a weir. The total proposed weir length is 96 feet with crest elevation at 1813. The maximum 100 year water surface elevation is 1816. The stage discharge relationships are summarized in Table 3. Two 10' x 5' RCB culverts will convey flow from the outlet structure through the embankment to the outfall channel.

The inflow and outflow hydrographs for the detention basin with the proposed two level outlet is shown in Figure 1. Figure 2 shows the relationship of the three hydrographs which contribute to the total hydrograph, and the total hydrograph at the Las Vegas Wash.

The two level outlet optimizes the use of existing facilities, and reduces the storage requirements of the detention basin by approximately 400 acre-feet (645,000 CY of excavation). This also makes it more feasible to move the embankment further north off of the more expensive land and avoiding the recently constructed electrical transmission facilities.

DIVERSION

The diversion from Sloan Channel through the Golf Course has also been revised. The existing soil cement portion of Sloan Channel had an original design capacity of 2,600 cfs, however, to meet current freeboard criteria and to limit flow velocity to 10 fps the proposed capacity limit is 1,400 cfs. The diversion structure will cause flow to begin to

spill into the golf course channel when the flow exceeds 800 cfs. A constriction in Sloan Channel will produce increased backwater depth and diverted flows will spill over a control weir 200 feet long and 6 feet above the invert. This diversion reduces the volume of flow into the detention basin and maximizes the use of the existing Sloan Channel.

RESULTS

The new hydrology, two level outlet, and diversion produce the design flows as indicated in Table 4 and as shown in Figure 3.

COSTS

The revised hydrology increased the storage requirements for the Alternative 2 presented in the Predesign Report. It has also been determined that land costs south of Alto are approximately $35,000 per acre and it is better to move the embankment north of Alto. It has also been determined that haul and disposal costs have declined. The cost estimate for Alternative 2 has been revised to reflect these changes and is shown in Table 5.

The newly proposed diversion and two level outlet design reduces the storage requirements of the detention basin. This alternative is labeled Alternative 3 and costs are presented in Table 6. As indicated from the cost estimates this alternative produces a savings of approximately $2,300,000.

November 24, 1992

Dear Mr. Folk:

Boyle Engineering Corporation (Boyle) has been performing predesign engineering for the Confluence Detention Basin. The detention basin is located near Nellis Air Force Base in the north east portion of the Las Vegas Valley near the confluence of the East and West Range Washes. The Clark County Regional Flood Control District (CCRFCD) has requested that Boyle submit the proposed concept for the Probable Maximum Flood (PMF) emergency spillway to the State Engineer for review and comment.

The detention basin is located on the East Range Wash, east of the Nellis Air Force Base Golf Course. A diversion will divert high flows through the golf course to the detention basin, approximately 1000 cfs, during the 100-year event, will remain in the existing Sloan Channel and bypass the detention basin. Enclosed is a figure indicating the proposed facilities and a copy of USGS map with the detention basin location indicated.

The PMF reaching the basin was evaluated two ways. (1) A storm over both East and West Range Washes had an average areally reduced rainfall of 9.2 inches. Approximately 3000 cfs (full capacity of the golf course channel) was estimated to be diverted to the basin from the West Range Wash. 59,000 cfs was generated from the East Range Wash. This created a total flow of 62,000 cfs to the Detention Basin. (2) With a storm centered over just the East Range Wash, the areally reduced rainfall was 10.0 inches. This produced a flow of 74,000 cfs on the East Range Wash. The larger flow of 74,000 cfs will be used for design. The HEC-1 hydrologic analysis is enclosed.

The proposed spillway concept utilizes the golf course area to convey PMF flows. As the water surface in the detention basin rises, the flow begins to flow around the detention basin and through the golf course. A portion of the west embankment of the detention basin, 1000 feet long, would also serve as a spillway. The crest at elevation 1816, would vary from 0 to 2 feet above existing grade, therefore, it would not require extensive erosion protection or energy dissipation. The spillway would be constructed of soil cement or roller compacted concrete. As the water surface rises above elevation 1816 it begins to overtop the spillway on the west embankment, it also begins to back up into the golf course area to the north and west. The banks of the channel through the golf course would begin to be overtopped. The flow through the golf course negates the need for the full PMF spillway on the detention basin embankment. Calculations for the stage and discharge relationships for the PMF are enclosed.

. . . continued

It may be noted that the detention basin and conveyance facilities provide 100-year flood protection to the golf course, which it presently does not have. Also, for major flood events such as the PMF, the golf course area would be flooded with or without the detention basin and regardless of its configuration.

The west dam embankment downstream of the spillway section is proposed to be armored with soil cement to protect the toe while the PMF flows around the detention basin. The proposed height of the embankment crest is 1823. Cross-sections of the spillway and the west embankment are shown in the attached Figures labeled 13 and 14.

Boyle is proceeding with design under the assumption that the proposed concept will be acceptable. Please review the attached calculations and proposed spillway concept and notify Boyle with your comments. Please call if you require any additional information.

Very truly yours,

BOYLE ENGINEERING CORPORATION

Donald W. Davis, PE

1. INTRODUCTION

A. Background

The proposed Confluence Detention Basin and Sloan Channel Improvements are part of the current Clark County Regional Flood Control District (CCRFCD) Flood Control Master Plan for the 150-square-mile Range Wash drainage basin. A description of the study area, a basinwide hydrologic evaluation, evaluation of alternative facilities, recommended facilities for the entire basin, and preliminary designs are presented in "Western and Eastern Tributaries of Range Wash Flood Control Facility Plan, prepared for the City of North Las Vegas by Boyle Engineering *Corporation (Boyle), June 1991" (Facility Plan).*

The proposed facilities are located in the southern portion of the Range Wash basin in northeastern Las Vegas Valley within and adjacent to Nellis Air Force Base (NAFB) (Figures 1 and 2). The proposed facilities depicted in Figure 2 consist of the following major components:

western?

1) An eastern inlet channel, approximately 4,400 feet long, which diverts flood waters east from the existing lined Sloan Channel *across the NAFB Golf Course and to the proposed Confluence* Detention Basin.
2) The Confluence Detention Basin with approximately 1,300 AF of storage capacity, just east of the NAFB Golf Course.
3) A concrete-lined outlet channel extending southerly for about 1,900 feet from the detention basin to a connection with the existing Sloan Channel.

The proposed improvements are intended to provide immediate relief from flooding problems to low-lying areas adjacent to the under-capacity, Sloan Channel several miles downstream of the proposed detention basin. This area is presently mapped as an "A Zone" on FEMA Flood Insurance Rate Maps.

B. Purpose and Scope

The purpose and scope of this Predesign Memorandum is to:

1) Present a preliminary environmental site assessment report on the project area to identify the potential for environmental problems that might be encountered on private properties proposed for right-of-way in the area of the Confluence Detention Basin.
2) Present results of a reconnaissance geotechnical investigation intended to document engineering properties of surficial soils and subsurface conditions along the channel alignments and in the area of the detention basin, and provide an initial assessment of the suitability of on-site soils for embankment and soil cement construction.
3) Present preliminary analysis of the hydraulic and hydrologic considerations establishing the peak flows (e.g., 100-year, PMF) and other criteria important to the design of the proposed facilities.
4) Summarize the design features and dimensions of proposed channels, crossing structures, dam embankment, spillway and basin outlet works.
5) Determine the availability of land (land ownership) and probable right-of-way needs for the proposed facilities.
6) Provide a preliminary estimate of the quantities and costs for the project.
7) Provide a preliminary evaluation of other construction issues, including: impact of construction on the operation of NAFB Golf Course and possible utility conflicts.

2. SUMMARY OF PRELIMINARY ENVIRONMENTAL AND GEOTECHNICAL ASSESSMENTS

As part of the predesign investigations, Converse Environmental Consultants Southwest and Converse Consultants Southwest (Converse) undertook preliminary environmental and geotechnical studies in the project area. Full reports on both studies are included in Appendix A and B to this Predesign Memorandum. Brief summaries of both reports are provide below:

A. Results of Geotechnical Assessment

Converse performed a soils and geologic reconnaissance of the project site, including the proposed NAFB golf course channel, Confluence Basin area, and the outlet channel reach. The investigation included a total of eight (8) borings and test pits of varying depth from 10 to 30 feet, and various laboratory and field tests on the materials encountered.

Surficial soils (0-3 feet) were generally found to consist of sandy or silty loams. Underlying materials were generally soft to firm clays and silts, stiff clays and intermixed sand and gravel layers. Caliche was not encountered in the upper 10 feet of the borings or test pits.

The report states:

> Laboratory test results indicate that the on-site soils have low to moderate dry densities, a low to moderate shear strength, a low to moderate permeability, a low to high potential for gypsum solubility, a low to moderate clay swell potential, a low chemical (salt) heave potential, and contain sulfate salts in sufficient concentrations to be severely corrosive to concrete, soil cement and metal. The on-site soils should be considered to be moderately to highly susceptible to hydro-collapse. Silts and fine sands are susceptible to piping. . .
>
> The on-site soils are suitable for use as materials for embankment fill and soil-cement. . . Based on preliminary slope stability analyses, the planned 2-1/2:1 or 3:1 (horizontal to vertical) slopes for the embankment appear to be stable. . . Seepage through and stability of the embankment should not be a concern.
>
> In order to provide (final) geotechnical design recommendations for the proposed project, additional field exploration, laboratory testing and engineering analysis should be performed. The amount of loose, soft and hydro-collapsible surficial soils present on the site and the extent of the cemented soils should be further investigated during the design level geotechnical investigation. The permeability and the corrosion and solubility potentials of the on-site soils should also be further evaluated.

Converse noted no significant geologic or seismic hazards during their preliminary investigation. Ground water was not encountered in any of the test pits or borings.

B. Results of Environmental Assessment

Converse's preliminary environmental assessment covered an area surrounding the proposed site of the Confluence Basin and south along the outlet channel (along Toyiabe Street) to the Sloan Channel. Work included a site reconnaissance, review of historic air photos, review of zoning history, several soil samples for lab analysis and a review of agency records regarding hazardous wastes, environmental issues, etc.

Converse noted considerable amounts of domestic and construction debris on-site, including concrete waste, tires, abandoned furniture and appliances, and waste wood products. The site does not appear to have a history of industrial/chemical uses and no other issues of "obvious environmental concern" were encountered.

Converse also evaluated limited records made available by NAFB regarding a landfill located just west of the proposed detention basin. It did not appear that old landfill operations had extended into the detention basin site. However, the Converse report (page 10) noted a possibility of seepage of alteration of ground water gradients and a subsequent environmental impact caused by leaching of landfill deposits. The Converse Environmental report was completed before the geotechnical investigations Summarized in Section A. above.

After the geotechnical investigation, Converse further evaluated the possibility of impact to groundwater quality. A letter from Converse is included in Appendix B. The letter concludes:

> With the anticipated low permeability of the on-site soils, the short detention time, the depth to groundwater and the distance of the old landfill from the basin, it appears that

water detained from the embankment will not influence the old landfill and the existing groundwater quality.

Design of the detention basin will be further coordinated with Converse to insure that criteria to avoid negative impacts to groundwater quality are satisfied.

A Draft Environmental Impact Statement (DEIS) has been prepared for the CCRFCD Flood Control Master Plan of 1986. Since the Confluence Detention Basin was not included in the 1986 plan, a site specific analysis will be required in accordance with Section 14 of the DEIS. The Section 14 analysis will further clarify environmental issues and establish implementation and mitigation requirements, and will be performed concurrent with the design phase of the project.

Converse reviewed the DEIS and concluded that the Confluence Detention Basin was not impacted by designated culturally sensitive areas and that federally listed plant species are not expected to occur in the area. A letter from Converse, reviewing environmental issues, is included in Appendix B.

Relating to Paleontological assessment, the CCRFCD sent a letter, to the County, regarding this project which set forth the following:

> The paleontological assessment for the District's master plan has been completed and accepted by the Bureau of Land Management (BLM). . . . The assessment does not identify the project area as one of concern; therefore, no further paleontological work should be required.

Relating to desert tortoise mitigation, the letter stated the following

> Mitigation measures to protect the existence of the desert tortoise will be in accordance with the District's biological opinion (Opinion) as amended. Recent amendments to the Opinion have revised mitigation measures to be consistent with those required by the Habitat Conservation Program (HCP). Temporary tortoise proof fencing will not be required. Mitigation fees for the loss of tortoise habitat have already been paid by the District for this and other projects. It should be clear that the HCP does not apply to this project.

A desert tortoise survey will be performed, by Dames and Moore per contractual agreement with the CCRFCD, within 90 days prior to construction. 30?

3. OVERVIEW OF PROJECT FLOOD CONTROL ALTERNATIVES

A. Previous Investigations

After considerable study, Alternative IV of the 1991 Range Wash Facility Plan was selected for inclusion in the CCRFCD Master Plan. Figure 3 shows the overall flood control concept, 100-year flows, and the location of the Confluence Detention Basin. Note that the design flows (fully developed land use conditions) into the Confluence Basin are 3,300 cfs from the West Range Wash and 3,140 cfs from the East Range Wash. The 3,300 cfs flow from the West Range Wash was to be diverted from the existing Sloan Channel at NAFB, across the golf course, and into the Confluence Basin (See Figure 2). The Facility Plan estimate the required capacity of the Confluence Basin at 1,500 AF.

For this predesign investigation, the original concept for the diversion of West Range Wash flows through the NAFB Golf Course and the Confluence Basin was examined in more detail. Two alternatives emerged -- Alternatives 1 and 2, as described below.

B. Alternative 1 -- Full Conveyance of 100-Year Flood in NAFB Golf Course Channel to Confluence Basin

Alternative 1 is essentially identical to the original concept developed in the Facility Plan. As shown in Figure 4, it involves the complete diversion of the 100-year peak flow (3,350 cfs) from the existing Sloan Channel, a 90-foot wide base, 3:1 side slope, trapezoidal earth-lined channel through the NAFB Golf Course. A concrete-lined (6'x 2') low-flow channel would be constructed to convey a design flow of 1% of the 100-year flow. The existing Sloan Channel in NAFB would be abandoned.

BOYLE ENGINEERING CORPORATION

Refined hydrologic analysis (see Sections 4 and 6) performed for this memorandum showed that the capacity of the Confluence Basin could be reduced from 1,500 AF to 1,330 AF. The design outlet flow from the basin was determined to be 1,300 cfs as opposed to 1,200 cfs estimated in the *Facility Plan (see Figure 3).*

C. Alternative 2 -- Split Conveyance of 100-Year Flood in NAFB Golf Course And Existing Sloan Channels

This alternative would entail the splitting of flows between existing Sloan Channel and the proposed NAFB Golf Course Channel. Several hydrologic evaluations of differing diversion ratios and detention basin outflow rates were performed. The runs were used to roughly optimize the facilities. As shown in Figure 5 at the 100-year design flow of 3,300 cfs Sloan Channel would convey 580 cfs; the golf course channel would convey 2,750 cfs. The low flow would remain in Sloan Channel. A diversion control structure would be needed at the juncture of the existing Sloan and proposed NAFB Golf Course Channels.

Refined hydrologic analysis indicates that under Alternative 2, the capacity requirement for Confluence Basin would be 1,280 AF. The design outlet flow from the basin would be about 970 cfs.

D. Comparison of Alternatives

Comparison of the two alternatives suggests that Alternative 2 (split conveyance) has several advantages over Alternative 1.

1) *The 4,000-foot long low-flow channel in the NAFB Golf Course* Channel is eliminated (as are two low-water culverts for golf course vehicles).
2) The golf course channel width can be narrowed (by about 10 feet) thereby reducing excavation quantities and costs.
3) Sediment transport in the golf course channel and to the detention basin will be reduced since the bed load would be conveyed along the bottom of the existing Sloan Channel.

FIGURE 5

4) Storage and excavation volumes required for the Confluence Basin are reduced by about 50 AF (100,000 CY).
5) The size and cost of the detention basin outlet works would be reduced.
6) The outfall channel from the basin (existing right-of-way width of 40 feet) could be a less costly trapezoidal channel (rather than a rectangular channel) due to the reduced design flow (970 versus 1,300 cfs).

Disadvantages of Alternative 2 include the following:

1) The existing Sloan Channel through NAFB and its associated right-of-way could not be abandoned and put to other uses.
2) Both the Sloan and NAFB Golf Course Channels would require maintenance.

Preliminary cost estimates presented in Section 10 of this Predesign Memorandum indicate that construction of Alternative 2 would probably be $800,000 less than Alternative 1. For this reason, and based on the other advantages cited above, Boyle recommends that the Alternative 2 concept be adopted for final design.

4. HYDROLOGIC EVALUATION

A. Design Storms and Peak Flows for Sizing of Proposed Facilities

The basic hydrologic analysis used in this investigation was originally developed in the Facility Plan. Hydrologic methods and assumptions were all in compliance with the CCRFCD Hydrologic Criteria and Drainage Design Manual (Criteria Manual). Details of the hydrologic analysis were fully documented in a special Technical Appendix to the Facility Plan and, therefore, will not be represented here.

The hydrologic subbasin boundaries used are shown in Figure 6. The hydrologic analysis employed the Corps HEC-1 model as applied to designated storm areas A, B, C, D and E shown in Figure 7. For this

STORM SCHEMATIC

FIGURE 7.

Predesign Memorandum, minor modifications were made to the original HEC-1 model as a basis for evaluation of the "split conveyance" concept described in Alternative 2 (Section 3.C.); and to further refine the capacity requirements of the Confluence Basin.

Design capacity of the inlet channel (NAFB Golf Course Channel), the Confluence Basin, and the outlet channel were based on the design storm producing the most severe conditions. For the inlet channel, a capacity requirement of 3,350 cfs (2,750 cfs under Alternative 2) was derived from Storm D in Figure 7. The capacity of the Confluence Basin was determined at 1,330 AF (or 1,280 under Alternative 2) based on a design storm covering areas B, C and D in Figure 7. The outlet channel capacity was determined at 1,300 cfs (970 cfs under Alternative 2) based on Storm B, C, D.

Applicable HEC-1 model runs for the above cases are provided in Appendix C.

B. Probable Maximum Flood

To meet requirements of the Nevada State Engineer (NSE), the dam embankment must be protected against failure during the PMF. Discussion with NSE indicated it was acceptable to base design on the PMF for the East Tributary of the Range Wash (area BC, Figure 7) plus the full capacity of the channel from the West Tributary of the Range Wash (assumed at 4,000 cfs). Larger flows would overflow existing and future Sloan Channel and bypass the Confluence Basin, generally draining to the Las Vegas Wash several miles south (see Figure 3).

The PMF flow based on the above assumptions was determined to be 57,000 cfs. See Appendix C for HEC-1 model run for the PMF.

5. PROPOSED DESIGN FEATURES OF INLET CHANNEL

A. Alignment Consideration

The alignment of the inlet channel from the existing Sloan Channel to the proposed Confluence Basin has received much study over a 3-year period. The Facility Plan originally examined the area due south of the NAFB Golf Course as the optimum location for the Confluence Basin. With a basin in this location, the inlet channel from the West Tributary could have utilized the existing Sloan Channel. However, further evaluation showed the proposed site would conflict with an historic NAFB landfill having the potential for hazardous waste problems.

Consequently, Boyle, the City of North Las Vegas and CCRFCD decided to locate the Confluence Basin due east of the NAFB Golf Course at the location shown in Figure 2. This required that the inlet channel traverse the NAFB Golf Course. A number of negotiating meetings were held with NAFB in 1989 and 1990 resulting in general agreement on the concept of golf course channel. More than a half dozen alignment alternatives were investigated. On April 15, 1991 Mr. Gary Holler of the City of North Las Vegas received a letter from Colonel Blair agreeing to the present alignment concept, contingent upon a number of conditions. These conditions included maintenance of access roads, relocation of utilities, decorative bridges, and other terms.

During the present Predesign investigation, Boyle refined the agreed upon alignment and met again with CCRFCD, CCPW and NAFB personnel to discuss various details. A landscape architect was employed to produce colored renderings of the proposed channel alignment, fairway and bridge crossings, and other features. A more detailed hydraulic analysis was used to minimize the width (and impact) of the proposed channel in the golf course operation.

The work described above resulted in the colored concept schematic shown in Figure 8. Major features include: a diversion structure at the junction with the existing Sloan Channel, a rerouted roadway to allow for

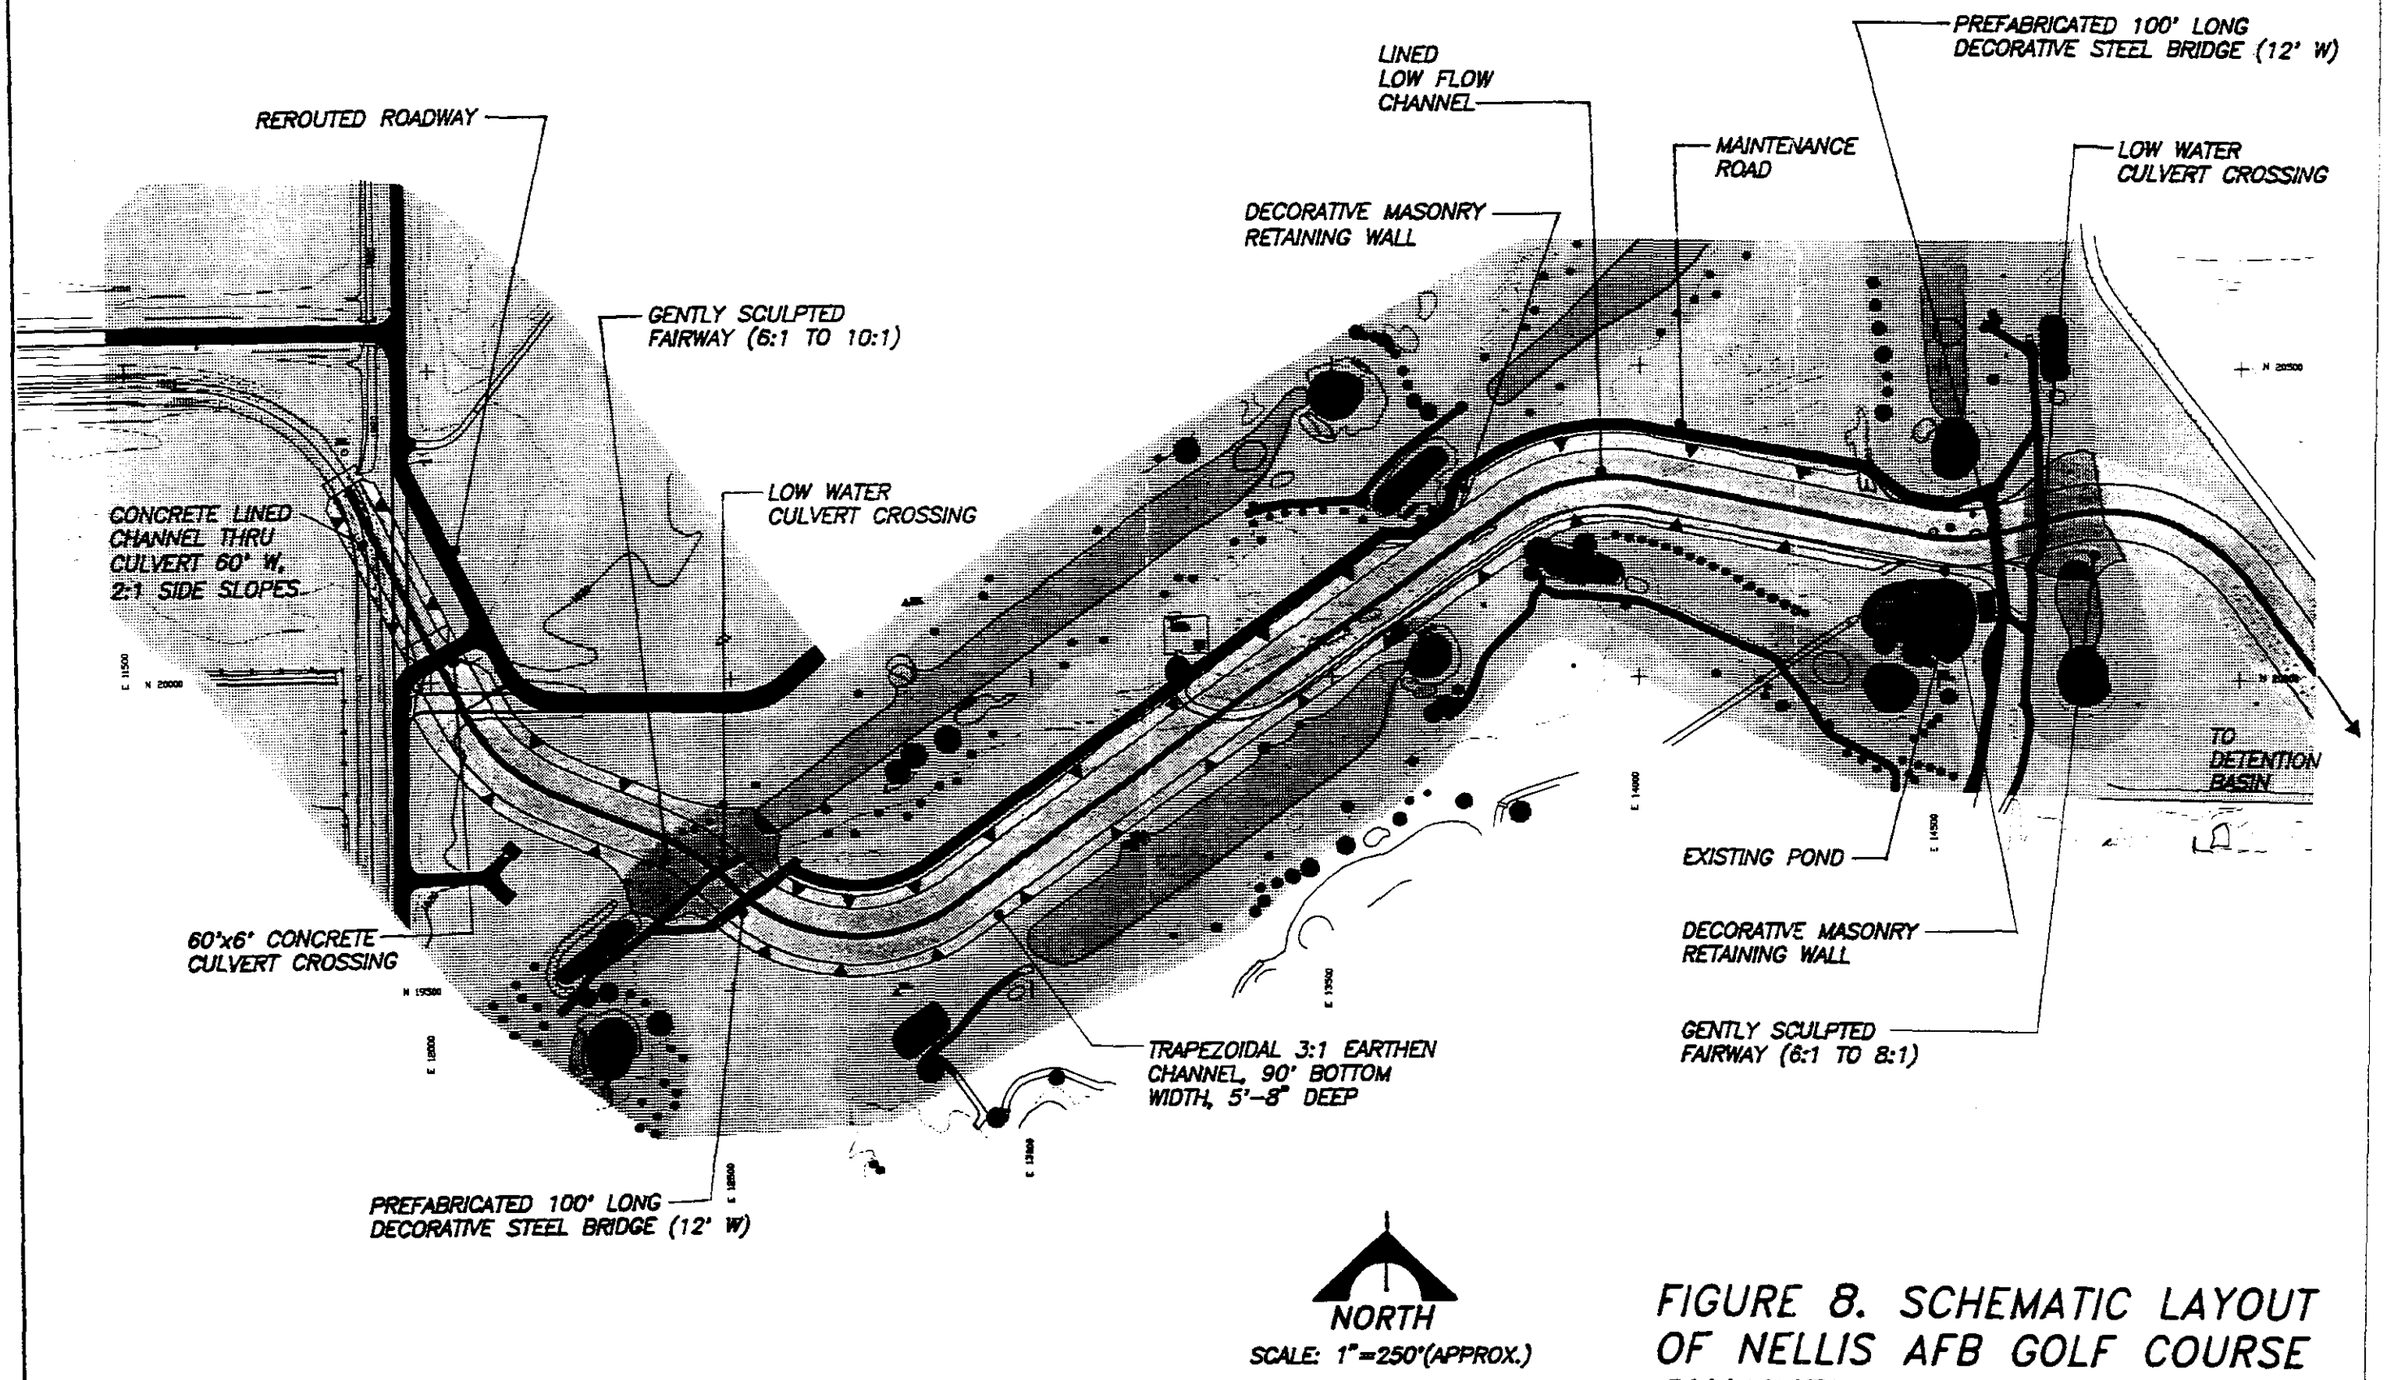

FIGURE 8. SCHEMATIC LAYOUT OF NELLIS AFB GOLF COURSE CHANNEL

single 90^{O} culvert crossing, 300 feet of trapezoidal concrete-lined channel with 50-foot base width and 2:1 side slopes, 4,000 feet of trapezoidal unlined channel with 80- to 90-foot base width and 3:1 side slopes through the golf course, several low- and high-water crossings in the golf course, and a lined (or graveled) low-flow section in the middle of the earth-lined channel. Further details of the proposed channel features and design criteria are described in the sections following.

B. Hydraulic Considerations

The inlet channel will be designed in conformance with Section 7.0 of the CCRFCD Criteria Manual.

The preliminary geotechnical investigation included two borings in the channel alignment, which indicated the channel to be in clay soils. Maximum velocities in the 90-foot wide earthen channel through the NAFB Golf Course will be slightly less than 6.0 fps, the allowable velocity for clay soils, at the 3,350 cfs 100-year flow. Slopes are quite flat, ranging between 0.1% and 0.2%. Maximum velocities in the uppermost concrete-lined section of the inlet channel (50-foot wide, 2:1 sides) will be less than 10 fps, except immediately below the diversion structure at the existing Sloan Channel where velocities may approach 15 fps.

Flow depths in the channel will generally reach 5.5 feet. The flow regime will remain subcritical throughout. Plan and profile sheets for the channel, including preliminary hydraulic grade lines, are provided in Plates 1, 2, 3 and 4.

Rip-rap lining will be utilized immediately downstream of the roadway culvert crossing (see Figure 8) at the point of transition to the earthen channel.

C. Sloan Channel-to-NAFB Channel Diversion

The proposed diversion structure for Alternative 1 would divert the total flow of the existing Sloan Channel (3,350 cfs) through the golf course and

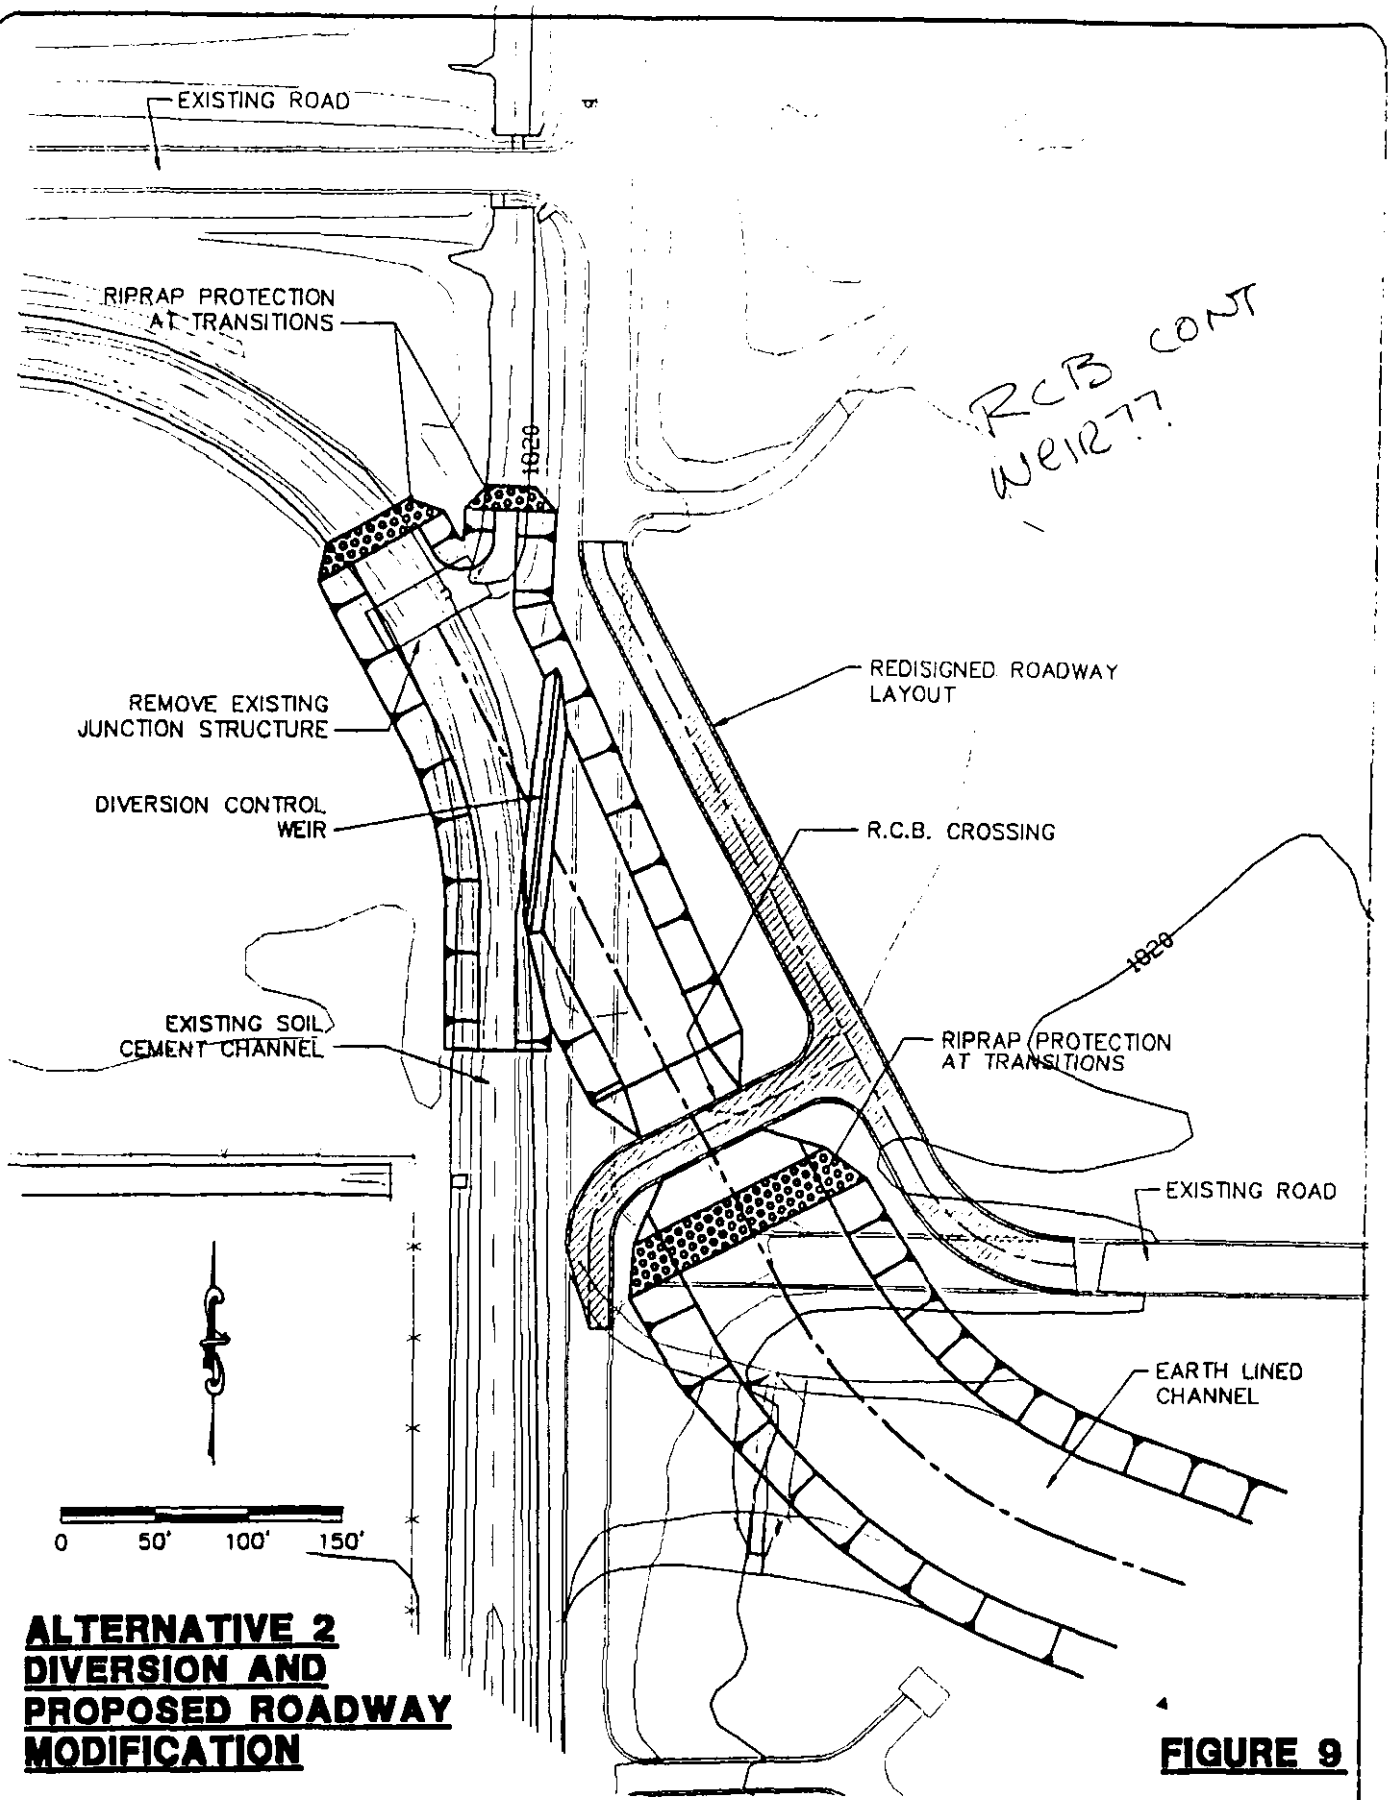
into the detention basin. The diversion would transition from an existing concrete section (14-foot wide base, 2:1 sides) of Sloan Channel to a new 50-foot wide base, 2:1 concrete section; and then through the culvert crossing at the redesigned roadway as shown in Figure 8.

The proposed diversion structure for Alternative 2 would confine low flows to the existing channel (14-foot base width and 2:1 side slopes). The west bank of the existing channel would be reduced in height to form a sill to allow controlled spill into the golf course channel. A conceptual design of the diversion is shown in Figure 9. At peak discharge 580 cfs would remain in Sloan Channel and 2,750 cfs would spill into the golf course channel. Final design of this diversion structure will require a more detailed analysis not undertaken for this memorandum. Additional analysis to further optimize the facilities and the amount of flow diverted in each direction will be performed in the design phase.

As mentioned previously, the diversion from the existing Sloan Channel will also involve the need for a new crossing structure (five 12'x 6' RCB culverts) under a modified roadway (Figures 8 and 9). The roadway will be redesigned to preclude the need for two skewed crossing structures for the diversion channel, NAFB officials have given tentative approval to the new roadway concept.

D. Channel Features and Dimensions

Below the modified roadway culvert, the inlet channel will transition to an earthen trapezoidal section with 80- to 90-foot base width and 3:1 side slopes. Through the two golf course fairways, the channel will be grass-lined with 6:1 to 10:1 side slopes. At the location where a drainage channel from the north joins the golf course channel, the embankment will be armored and protected from erosion. The inlet channel, which will be approximately 4,400 feet in length from Sloan Channel to the Confluence Basin, will also have a low-flow channel (Alternative 1) or gravel drain (Alternative 2).



ALTERNATIVE 2 DIVERSION AND PROPOSED ROADWAY MODIFICATION

FIGURE 9

Decorative masonry retaining walls will be equipped at two locations (Figure 9) to preclude modification of a tee box and a green otherwise required by staying with a 3:1 channel side slope.

For Alternative 1, two low-water culvert crossings (6'x 3' RCB, 12-foot roadway) would be located as shown in Figure 8. Both Alternatives 1 and 2 would include two 100-foot long, 12-foot wide prefabricated (decorative) steel bridges constructed at locations shown in Figure 8.

Examples of the features described above are shown in Figures 10, 11 and 12.

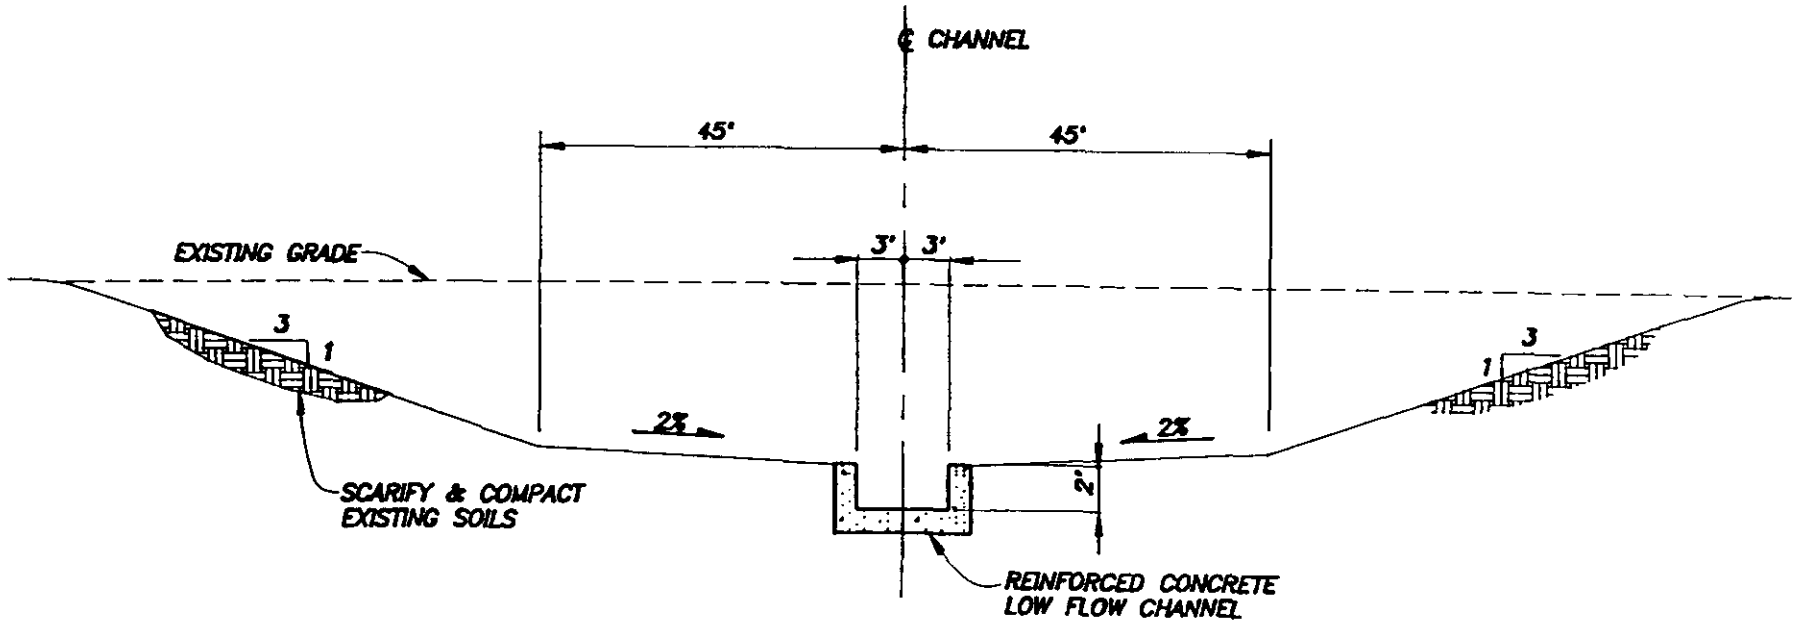
E. Maintenance Issues

Since the slope of the golf course channel is so mild, 100-year velocities (up to 6 fps) should be non-erosive to the naturally clay-lined earthen channel. The 10-foot wide by 2-foot deep coarse gravel drain proposed for Alternative 2 should also be non-erosive. Some erosion may occur in localized areas (e.g., bends) under high flows. Sediment deposition is likely to occur in the channel after major events and require maintenance. The concrete low-flow channel of Alternative 1 would probably collect much of the sediment, but would be relatively easy to clean. Under Alternative 2, the golf course channel would likely exhibit only minor sediment deposition because low flows and most of the bed load conveyed during high flows would continue in the existing Sloan Channel. Low flows from smaller storms would stay in the Sloan Channel, therefore, the Golf Course Channel would require less frequent maintenance with Alternative 2.

6. PROPOSED DESIGN FEATURES OF DETENTION BASIN

A. Location and Layout

The general location of the detention basin is similar to that proposed in the 1991 Facility Plan, however, availability of more detailed topography and land ownership patterns for this project led to several proposed changes in



ALTERNATE 1 TYPICAL SECTION

FIGURE 12.

basin layout. The basin was extended approximately 700 feet further south to reduce the amount of excavation and to increase the natural storage. Also, the proposed basin does not extend as far to the east or north as originally proposed, but incorporates a low-lying area at the northeast end where the future channel from the East Tributary of Range Wash will enter the basin.

B. Hydrologic Analysis and Sizing

The required storage capacity of the basin estimated in the Facility Plan was 1,500 AF. Based on the updated hydrologic analysis described in Section 4 and Appendix C, the required storage has been reduced to 1,330 AF for Alternative 1, and 1,280 AF for Alternative 2, by increasing the efficiency of proposed outlet works.

The required storage capacity is determined by minimizing the costs of the detention and downstream conveyance improvements. The majority of Sloan Channel downstream of the detention basin is unlined. Conceptual analysis performed in the Facility Plan determined that, for Range Wash, maximizing detention is more cost effective than improving (enlarging) downstream conveyance capacity. The optimum release rate from the Confluence Basin was determined to be such that the flow at the juncture of Sloan Channel with Las Vegas Wash (Figure 3) resulting from a total storm area (storm over BCDE, Figure 7) was approximately equal to the flow resulting from a more intense storm centered below the detention basin (Storm E). This "target discharge" at the confluence with Las Vegas Wash was determined to be 3,100 to 3,200 cfs. (Note this is 100-200 cfs less that indicated in Figure 3).

The optimization effort for Alternative 2 (split conveyance) focused on meeting the 3,100-3,200 cfs "target discharge" at Las Vegas Wash. It was determined that to meet this target discharge, the release flow from detention basin combined with flow remaining in the existing Sloan Channel had to be limited to approximately 1,300 cfs during the total area storm (BCDE). It was found that diverting less flow from Sloan Channel (i.e., less flow to the basin, more in Sloan Channel) required a lower

release rate from the basin. This was found to increase the storage capacity requirements of the basin despite the smaller inflow to the basin. The optimized condition of Alternative 2 resulted in basin storage requirement of 1,280 AF (includes 130 AF for sediment storage).

A sediment yield analysis was performed and presented in the Facility Plan. The values from the Facility Plan were used to determine the sediment storage requirements of the detention basin. The estimated average annual sediment yield was .37 AF/square mile/year. The tributary area of the confluence detention basin is 82 square miles, resulting in an average annual yield of 30 AF/year. Per the Facility Plan, this volume was multiplied by a factor of 5.3 to estimate the 100-year design storm volume. The resulting volume is 160 AF. This is the proposed volume of sediment storage required for Alternative 1. The proposed volume for Alternative 2 was reduced by 20% to account for the bed load and portion of the flow which would continue to be conveyed in Sloan Channel.

C. Spillway

The Facility Plan proposed a spillway over a soil cement embankment section with a length of 1,600 feet and 15-foot drop located on the southerly embankment of the detention basin.

The newly proposed spillway concept is to allow a portion of the detention basin overflow to occur by overtopping of the banks of the inlet channel through the golf course.

It may be noted that the detention basin and conveyance facilities provide 100-year flood protection to the golf course which it presently does not have. Also, for major flood events such as the PMF, the golf course area would be flooded with or without the detention basin and regardless of its configuration.

A portion of the detention basin along the golf course, with bank at or near the existing grade (1,816 feet), would also be overtopped. Since this overtopping would occur near existing grade, it would not require extensive

erosion protection or energy dissipation. A cross-section of the emergency spillway on the detention basin west embankment is shown in Figure 13.

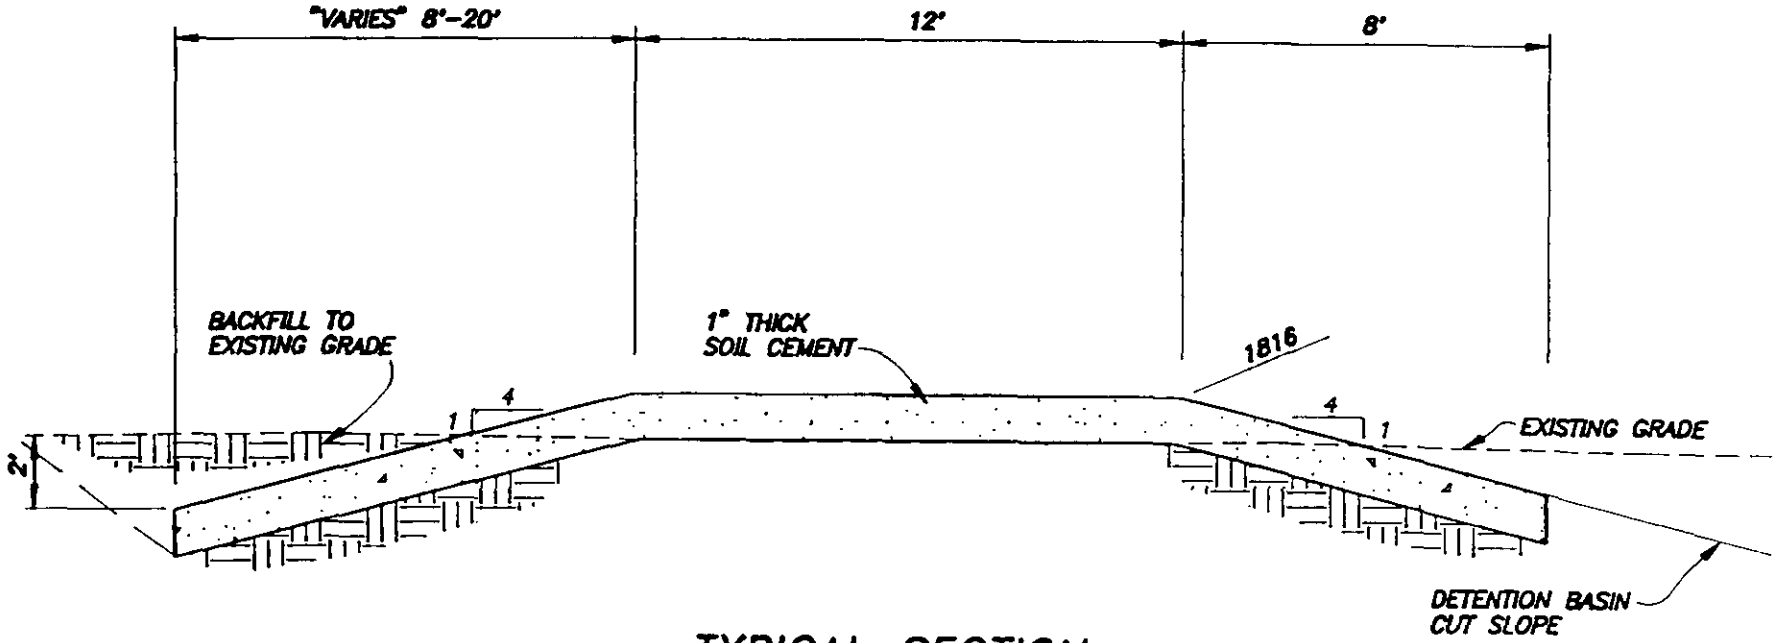
During the PMF, the emergency spillway on the west embankment would begin to spill when the water surface rises above an elevation of 1,816. When the water surface exceeds 1,816.5 feet it would begin to overtop the banks of the inlet (NAFB Golf Course) channel. The length (4,000 feet) of the inlet channel through the golf course contributes to the length of the spillway negating the need for the full PMF spillway on the detention basin embankment. The total length of the channel would not function as an effective weir length due to curves in the alignment and the general inundation of the golf course, however the PMF would simply flow around the detention basin and through the golf course with an effective flow width of approximately 3,000 feet.

The west dam embankment is proposed fo be armored with soil cement to protect the toe while PMF flows flow around the detention basin. A typical cross-section of the west dam embankment is shown in Figure 14.

The emergency spillway concept described also allows the 100-year water surface in the detention basin to be raised to 1,816 feet; thereby reducing the amount of excavation required for storage in the basin by more than 180 AF (290,000 CY).

D. Outlet Works

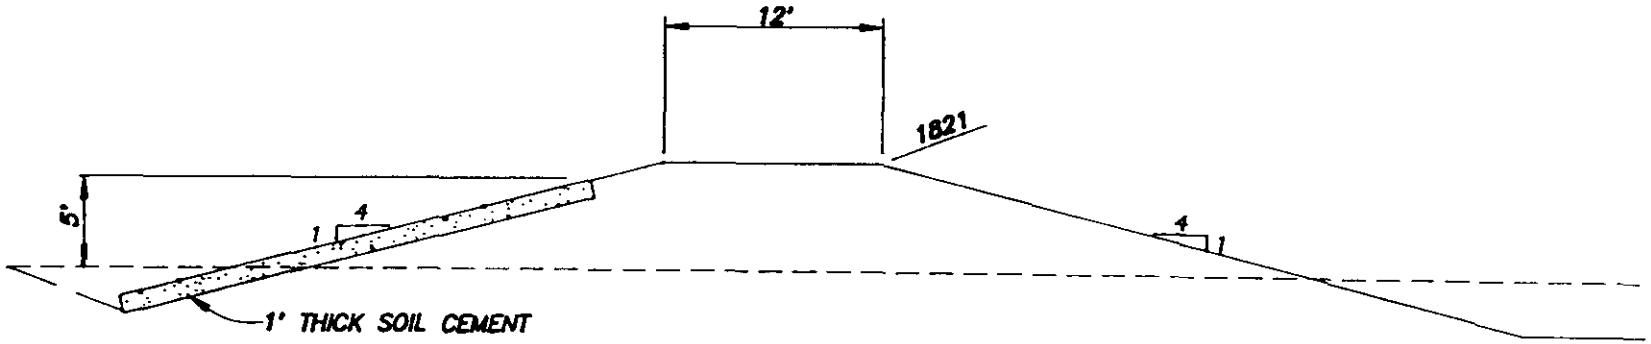
To minimize storage requirements in the detention basin, the outlet works will be designed for efficiency at low head. The proposed outlet structure has a lip raised above the basin floor to help trap sediment, a gravel drain with perforated pipes to drain the bottom of the basin, a trashrack, and four 5' x 3' RCB outlet culverts. The proposed outlet works are shown in Figure 15. The outlet works for Alternative 2 must have a lower release rate due to the flow remaining in the existing Sloan Channel. This outlet would have three 5' x 3' RCB culverts.



TYPICAL SECTION EMERGENCY SPILLWAY

SCALE: 1/4"=1'-0"

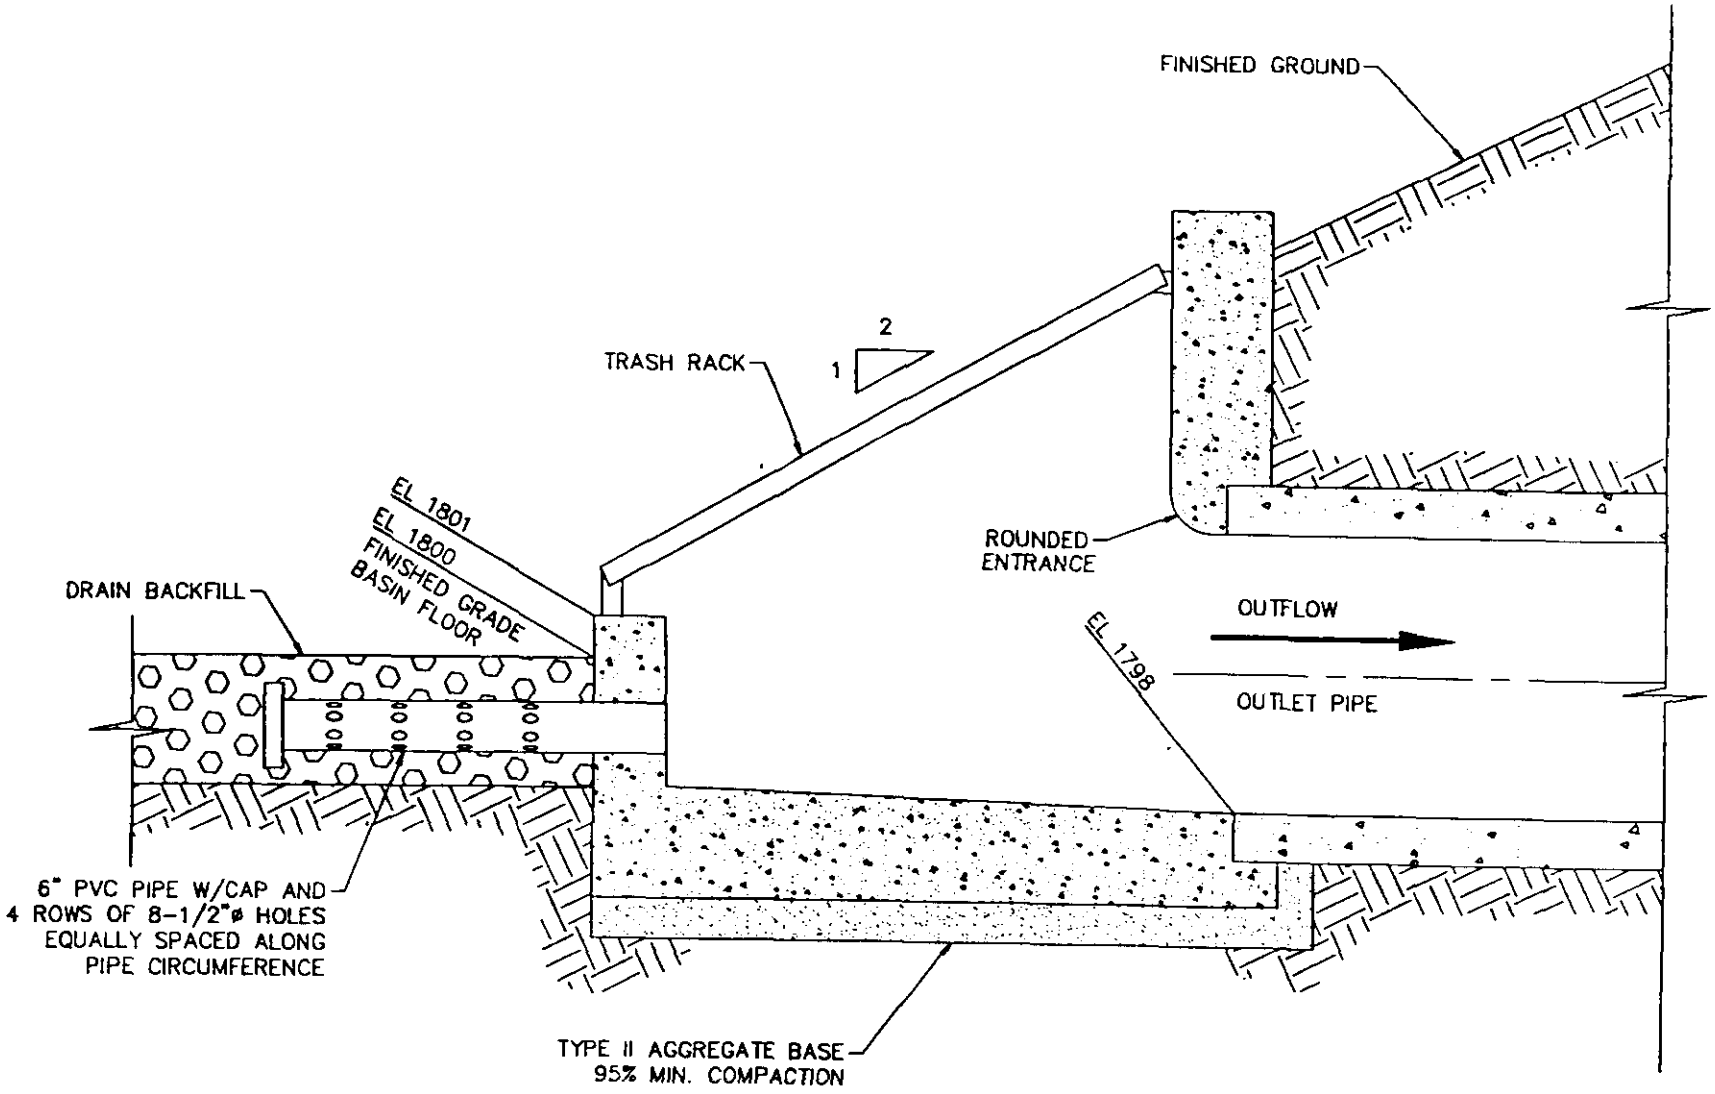
FIGURE 13



TYPICAL SECTION
WEST EMBANKMENT

SCALE: 1"=10'

FIGURE 14



TYPICAL BASIN OUTLET STRUCTURE

FIGURE 15

The outlets for Alternatives 1 and 2 would utilize a hydraulic concept whereby initial operation would be by "inlet control"; as the depth or head increases there is a change to "outlet control". This minimizes the changes in discharge with respect to changes in head.

One option considered a larger flow remaining in Sloan Channel and less flow diverted to the detention basin. To delay and reduce the peak flow out of the basin, a less efficient (strictly outlet control) 84-inch RCP outlet was considered. It produced acceptable downstream flows, but increased the storage requirements of the detention basin by approximately 50 AF (81,000 CY of additional excavation). Additional efforts to optimize the basin will be performed in the design phase as refinements are made.

E. Grading Plan

The grading plan for the basin will not be finalized until the design phase of the project. Figure 16 shows the preliminary grading concept. The basin is proposed to have a minimum cross-slope of 0.5% in accordance with the CCRFCD Criteria Manual. There will be low-flow channels (from West and East Tributaries) through the basin with a minimum slope if 0.25%. The grading plan may be different depending on the Alternative selected for final design. It is important for Alternative 1 to have a more efficient outlet at lower head, therefore, it is proposed to have a smaller, deeper area at the downstream end of the basin that would quickly increase the head on the outlet.

The preliminary grading plan utilizes an embankment with a top width of 12 feet and 3:1 (horizontal to vertical) embankment slopes. Final design may consider a flatter slope and wider top width to reduce the amount of excess material, improve aesthetic appearance and reduce erosion potential.

Preliminary earthwork estimates for the basin indicate approximately 1,000,000 CY of excavation and 125,000 CY of fill. Assuming a 30% compaction factor, approximately 575,000 CY would require haul and

disposal. Several nearby areas have been tentatively identified for disposal.

7. PROPOSED DESIGN FEATURES OF OUTLET CHANNEL

The proposed outlet channel would follow a straight alignment southerly for approximately 1,900 feet on the west side of Toyiabe Street. This alignment allows the use of an existing 40-foot wide channel right-of-way and an existing unlined drainage ditch.

The concrete-lined channel will be designed per the Criteria Manual with subcritical flow on a mild slope. The design flow for the outlet channel was based on a storm over the area BCD and is dependent on the outlet works of the detention basin.

Alternative 1 has a design discharge of 1,300 cfs. To confine this flow to within the existing right-of-way, a reinforced concrete rectangular channel with 38-foot wide base width is proposed. The channel cross-section is shown in Figure 17.

Alternative 2 has a design discharge of 970 cfs. This flow would be conveyed in a trapezoidal channel with 20-foot base width and 2:1 side slopes, as shown in Figure 18.

The confluence of the outlet channel with the existing Sloan Channel will require removal and reconstruction of the existing junction.

Plates 4 and 5 provide a preliminary profile of the outlet channel with hydraulic gradeline. Depth of flow will be approximately 4 feet. Velocities will be less than 10 fps.

8. RIGHT-OF WAY REQUIREMENTS

The preliminary land acquisition requirements for the Detention Basin are shown in Figure 19. A corresponding listing of the property owners and the land areas are given in Table 1.

Total Take = 207.86 acres

The inlet channel through the NAFB Golf Course will require a right-of-way width of approximately 150 feet, amounting to approximately 15 acres of required land acquisition from the U. S. A.

The outlet channel will be confined to a 40-foot right-of-way width. This will require 0.26 acres of acquisition from parcel 26-30-33, owner: PSM PPTYS. South of said parcel, there is an existing 40-foot wide right-of-way for drainage on the west side of Toyiabe Street.

9. UTILITY CONFLICTS

There are no records of existing utilities in the area of the detention basin. There are also no conflicts in the outlet channel alignment.

The inlet channel through the NAFB Golf Course will require the relocation of water mains and buried electrical cables. The major utilities in the area of the inlet channel are indicated in Figure 20. Irrigation facilities servicing the golf course are not shown due to lack of information. The project will require a field survey to identify and locate irrigation facilities. The water mains in the vicinity of the roadway crossing will require potholing. Final design will minimize the utility conflicts, if possible. The 8-inch water main, which crosses the channel at two locations, is assumed to require relocation at both locations.

10. PRELIMINARY ESTIMATE OF QUANTITIES AND COSTS

The preliminary estimates of quantities and costs for Alternatives 1 and 2 are summarized in Tables 2 and 3, respectively.

Land costs of $10,000/acre are assumed based on the most recent acquisitions of NAFB of properties in this vicinity. The relatively low land costs are due to the lands being unimproved, without utilities, in a flood prone area, and with high noise levels, adjacent to Nellis Air Force Base.

The largest cost associated with the proposed facilities is related to the quantity of disposal and haul required for detention basin construction. The final design will attempt to further reduce this quantity.

BOYLE ENGINEERING CORPORATION

A cost comparison of alternative embankment sections found that the proposed earth embankment was considerably less expensive than a roller compacted concrete embankment with a much smaller cross-section.

Soil cement was the most economical alternative for the spillway and for erosion protection of the embankment. The on-site soils are suitable for use in soil cement. Roller Compacted Concrete (RCC) would require import and mixing of additional aggregate and typically more cement. The extra strength of RCC or concrete lining is not warranted since velocities will be low. Rip rap would be more expensive since it is not available from on-site excavation.

Alternative 2 has less construction costs and would also have less maintenance costs, since more frequent smaller storm flows would remain in Sloan Channel and not affect the Golf Course Channel or detention basin. Alternative 1 may require maintenance in the golf course after every storm.

11. CONSTRUCTION ISSUES

A major construction issue is maintaining access roads and the integrity of golf course irrigation system during construction. NAFB also requests that golf course construction be scheduled for January 1993. This would require two separate construction contracts. The construction of the Confluence Basin and other appurtenant work would involve a separate contract of later date.

Boyle recommends there be a public presentation to the Sunrise Manor Town Board, to inform them of the project, and minimize the possibility of future objections.

Prior to construction the project will require standard approvals from the Director of Public Works, the County officials indicated in the County's standard title block, and public utilities. Approval by NAFB officials will also be required. A dam permit will be required from the Nevada State Engineer.

Attention: Mr. Walter Hines, P.E.

Subject: Preliminary Geotechnical and Geologic Investigations
Sloan Channel/Confluence Detention Basin
Near Nellis Air Force Base
Clark County, Nevada

Gentlemen:

We are pleased to submit the results of our preliminary geotechnical and geologic investigations conducted for the Sloan Channel/Confluence Detention Basin project located near Nellis Air Force Base in Clark County, Nevada. The study was performed in general accordance with our signed Standard Form of Agreement with Consultant for Professional Services, dated May 4, 1992.

The detention basin embankment should receive adequate support from a zone of properly placed and compacted structural fill. The on-site soils are suitable for use as materials for dike embankment fill. There do not appear to be adverse geologic or engineering considerations that would severely restrict the development of the proposed flood control facility.

Groundwater was not encountered to the depths explored for this project. Hard caliche and/or moderately hard partially cemented soils were encountered at one of the boring locations at a depth of about 19 feet. Rock excavation techniques may be required for any areas with deep cuts.

If you have questions concerning information contained in this report, please contact us at your convenience.

Respectfully submitted,

CONVERSE CONSULTANTS SOUTHWEST, INC.

IMPORTANT INFORMATION
ABOUT YOUR
GEOTECHNICAL ENGINEERING REPORT

More construction problems are caused by site subsurface conditions than any other factor. As troublesome as subsurface problems can be, their frequency and extent have been lessened considerably in recent years, due in large measure to programs and publications of ASFE/ The Association of Engineering Firms Practicing in the Geosciences.

The following suggestions and observations are offered to help you reduce the geotechnical-related delays, cost-overruns and other costly headaches that can occur during a construction project.

A GEOTECHNICAL ENGINEERING REPORT IS BASED ON A UNIQUE SET OF PROJECT-SPECIFIC FACTORS

A geotechnical engineering report is based on a subsurface exploration plan designed to incorporate a unique set of project-specific factors. These typically include: the general nature of the structure involved, its size and configuration; the location of the structure on the site and its orientation; physical concomitants such as access roads, parking lots, and underground utilities; and the level of additional risk which the client assumed by virtue of limitations imposed upon the exploratory program. To help avoid costly problems, consult the geotechnical engineer to determine how any factors which change subsequent to the date of the report may affect its recommendations.

Unless your consulting geotechnical engineer indicates otherwise, *your geotechnical engineering report should not be used:*

- When the nature of the proposed structure is changed, for example, if an office building will be erected instead of a parking garage, or if a refrigerated warehouse will be built instead of an unrefrigerated one;
- when the size or configuration of the proposed structure is altered;
- when the location or orientation of the proposed structure is modified;
- when there is a change of ownership, or
- for application to an adjacent site.

Geotechnical engineers cannot accept responsibility for problems which may develop if they are not consulted after factors considered in their report's development have changed.

MOST GEOTECHNICAL "FINDINGS" ARE PROFESSIONAL ESTIMATES

Site exploration identifies actual subsurface conditions only at those points where samples are taken, when they are taken. Data derived through sampling and subsequent laboratory testing are extrapolated by geotechnical engineers who then render an opinion about overall subsurface conditions, their likely reaction to proposed construction activity, and appropriate foundation design. Even under optimal circumstances actual conditions may differ from those inferred to exist, because no geotechnical engineer, no matter how qualified, and no subsurface exploration program, no matter how comprehensive, can reveal what is hidden by earth, rock and time. The actual interface between materials may be far more gradual or abrupt than a report indicates. Actual conditions in areas not sampled may differ from predictions. *Nothing can be done to prevent the unanticipated, but steps can be taken to help minimize their impact.* For this reason, *most experienced owners retain their geotechnical consultants through the construction stage,* to identify variances, conduct additional tests which may be needed, and to recommend solutions to problems encountered on site.

SUBSURFACE CONDITIONS CAN CHANGE

Subsurface conditions may be modified by constantly-changing natural forces. Because a geotechnical engineering report is based on conditions which existed at the time of subsurface exploration, *construction decisions should not be based on a geotechnical engineering report whose adequacy may have been affected by time.* Speak with the geotechnical consultant to learn if additional tests are advisable before construction starts.

Construction operations at or adjacent to the site and natural events such as floods, earthquakes or groundwater fluctuations may also affect subsurface conditions and, thus, the continuing adequacy of a geotechnical report. The geotechnical engineer should be kept apprised of any such events, and should be consulted to determine if additional tests are necessary.

GEOTECHNICAL SERVICES ARE PERFORMED FOR SPECIFIC PURPOSES AND PERSONS

Geotechnical engineers' reports are prepared to meet the specific needs of specific individuals. A report prepared for a consulting civil engineer may not be adequate for a construction contractor, or even some other consulting civil engineer. Unless indicated otherwise, this report was prepared expressly for the client involved and expressly for purposes indicated by the client. Use by any other persons for any purpose, or by the client for a different purpose, may result in problems. *No individual other than the client should apply this report for its intended purpose without first conferring with the geotechnical engineer. No person should apply this report for any purpose other than that originally contemplated without first conferring with the geotechnical engineer.*

INTRODUCTION

This report presents the results of our preliminary geotechnical and geologic investigations performed for the proposed Sloan Channel/Confluence Detention Basin Project in Clark County, Nevada. A vicinity map showing the location of the project within the Las Vegas Valley area is provided on Drawing No. 1. The purposes of this investigation were to (1) determine the geologic conditions and presence of any hazards or controlling features; (2) define general conditions in the area of the proposed facility, and delineate or determine the presence of any features which might impact location of the facility and (3) provide preliminary geotechnical recommendations for the proposed embankment/dike and channel. This study was performed in conjunction with a Preliminary Environmental Site Assessment (CECSW Project No. 92-43281-01).

We understand the project will consist of an earthen embankment and reservoir with emergency overflow spillway, outlet works, and inlet and outlet channels. The location and alignment of the spillway have not yet been finalized. Preliminary plans indicate that the maximum embankment height will be on the order of about 22 feet. It is assumed that the crest width will be a minimum of 12 feet. A slope of 2½:1 or 3:1 (horizontal to vertical) is planned for the embankment. The embankment will be about 8,000 feet in length and the inlet and outlet channels will be about 4,000 and 2,000 feet in length, respectively. The channels will be concrete or soil-cement lined in some sections and grass-lined in others. Some channel areas may use riprap or other erosion control measures. The project will be located adjacent to and on the Nellis Air Force Base golf course. The embankment and reservoir are tentatively located just east of the golf course. In the reservoir area, excavations are anticipated to be on the order of 6 to 8 feet. Preliminary plans indicate the detention basin will cover an area of about 150 acres and will have a maximum holding time of about 36 hours at full reservoir. Any seepage losses from the facility are not a concern, as long as stability of the structure is adequate and downstream development is not affected. Erosion protection will be required for the emergency spillway, channel slopes and the upstream face of the embankment. Erosion protection alternatives include graded riprap and soil cement. We were requested to evaluate soils for potential use as material for soil cement or roller compacted concrete (RCC).

In 1989, Converse Consultants Southwest, Inc. (CCSW) performed a Preliminary Geotechnical Evaluation for Facility Planning Upper Las Vegas Flood Control Projects in North Las Vegas (CCSW Project No. 88-33195-01). Our report, dated November 20, 1989 presented our findings and preliminary recommendations. The proposed project lies within the limits of the previous investigation. The detention basin will be located near the site referred to as *Potential Detention Site 1* in the previous investigation. Pertinent boring logs from the previous investigation are provided in Appendix C. The approximate location of the previous borings are indicated on Drawing No. 2.

SCOPE OF SERVICES

The following tasks were included in our scope of services:

1. A field reconnaissance of the area and mapping of the surface geology was performed by our field geologist. The surface geology was mapped in detail and the presence of different materials were either verified or determined. The results of the mapping are shown on Drawing No. 3 and are further explained in the following subsection *Geologic Soil Units*.

2. A field exploration program was conducted which consisted of drilling and excavating, logging, and sampling of two (2) exploratory borings to a depth of 30 feet and six (6) test pits to depths varying from 9 to 10 feet. The approximate location of the explorations are shown on Drawing No. 2. A description of the equipment and procedures used during the exploration program is presented in Appendix A. Summaries of the boring and test pit logs are also presented in Appendix A. Samples of the subsurface soils were obtained from the borings and test pits and were taken to our laboratory for further evaluation and testing.

DRAFT

3. Limited laboratory tests were conducted on selected soil samples. Tests included moisture content, in-place densities, permeability, solubility, clay swell, Atterberg limits, chemical analyses, maximum density, sieve analyses, and direct shear tests. Descriptions and results of the laboratory tests are presented in Appendix A.

4. Results of the field exploration and limited laboratory testing were evaluated and engineering analyses were performed to develop appropriate preliminary recommendations for the design and construction of the proposed project.

5. This geotechnical report was prepared to present the findings, conclusions and preliminary recommendations of this firm.

SITE CONDITIONS

TOPOGRAPHY AND VEGETATION

The topography of the site is characterized by the steep to moderately steep bedrock hills to the east, north, and northeast and the overall gentle slope of the alluvial fans to the north and east, and the alluvial flat at the site. Two small to medium-sized washes flow south and southeast, through the site and join near the center of the site and flow southeast off the site. These washes range in size from approximately 10 to 30 feet across. The flow grades of the these washes are gentle and fairly uniform through the site, averaging about a 10 foot vertical drop over 1000 feet horizontally. Areas between the washes are generally flat, with occasional refuse piles.

The subject site was sparsely vegetated with creosote and bursage. Scattered mesquite bushes were encountered near or in the wash channels. At the time of our investigation abundant desert grasses were present in areas outside of the wash channels.

An old Air Force Base landfill and gravel pits existed immediately west and east of the the site, respectively. The approximate limits of the landfill (dump) and gravel pits are indicated on Drawing No. 3.

GEOLOGIC SOIL UNITS

Within the project vicinity, six different geologic units were distinguished for the purposes of this work. Our mapping has been based upon aerial photographs, published geologic and soil maps, site reconnaissance and our field exploration program. Drawing No. 3 of this report shows the surface exposure and the approximate boundary of each unit. The geologic descriptions for the units are given below:

Goodsprings Soil (Unit 1)

This soil is described as a gravelly fine sandy loam with 2 to 4 percent slopes. It is a shallow, well drained soil located on erosional fan remnants and formed in mixed alluvium derived mainly from limestone and sandstone. Typically, about 90 percent of the surface is covered with a well developed pavement of pebbles. The subsurface is predominantly a pink gravelly fine sandy loam overlying a reddish brown and pinkish white, strongly cemented caliche. This caliche overlies a pink extremely gravelly loamy fine sand. The depth to cemented materials ranges from 9 to 20 inches. Permeability is moderate above the cemented materials; available water capacity is very low; and runoff is medium. The hazard of water erosion is slight and the hazard of soil blowing is high if the desert pavement is disturbed.

Weiser Soil (Unit 2)

This soil is described as an extremely gravelly fine sandy loam with 2 to 8 percent slopes. It is a very deep, well drained soil located on summits and side slopes of erosional fan remnants and formed in alluvium derived from various kinds of rock that have a high content of lime. Approximately 80 percent of the surface is covered with a desert pavement of pebbles. The subsurface is a light brown extremely gravelly fine sandy loam. Some areas of this soil have caliche at a depth of 40 to 60 inches or more. Permeability of this soil is moderately rapid; available water capacity is very low; and runoff is medium. The hazard of water erosion is slight and the hazard of soil blowing is moderate if the desert pavement is disturbed.

Caliza Soil (Unit 3)

This soil is described as a very gravelly sandy loam with 2 to 8 percent slopes. It is a very deep, well drained soil on erosional fan remnants and formed in alluvium derived from various kinds of rock. Typically, the surface layer is light brown very gravelly sandy loam about 3 inches thick. This overlies light brown very gravelly sandy loam which overlies light brown, stratified very gravelly coarse sand to very gravelly loamy sand. Permeability of this soil is moderately rapid; available water capacity is very low; and runoff is medium. The hazard of water erosion is slight, and the hazard of soil blowing is moderate. This soil is subject to rare periods of flooding during prolonged, high intensity storms.

Glencarb Soils (Unit 4)

This soil is described as a silt loam with 0 to 2 percent slopes. It is a very deep, well drained soil on recent alluvial flats and formed in alluvium derived from various kinds of rock. Typically, the surface layer is pale brown silt loam, about 6 inches thick. Below this, to a depth of approximately 60 inches, are alternating layers of very pale brown clay loams, silty clay loams, and very fine sandy loams. Permeability of this soil is moderately slow; available water capacity is high; and runoff is slow. The hazard of water erosion is slight and the hazard of soil blowing is high. This soil is subject to rare periods of flooding during prolonged, high intensity storms.

Bracken Soil (Unit 5)

This soil is described as a very gravelly fine sandy loam with 2 to 8 percent slopes. It is a deep, somewhat excessively drained soil on pediments and alluvial flats and formed in gypsiferous alluvium derived from various kinds of rock high in gypsum. Approximately 90 percent of the surface is covered with a desert pavement of pebbles and cobbles. The surface layer is pink very gravelly fine sandy loam, about 5 inches thick. Underlying the surface is a pink to white gravelly sandy loam with some gypsum crystals. Below this is weakly consolidated, gypsiferous sediment to approximately 60 inches. Permeability of this soil is moderately rapid; available water capacity is very low; and runoff is medium. The hazard of water erosion is slight, and the hazard of soil blowing is high if the surface is disturbed.

Las Vegas-Destazo Soil Complex (Unit 6)

This soil is described as mostly gravelly fine sandy loam with 0 to 2 percent slopes. This soil is shallow to very deep and well drained and forms on relict alluvial flats and formed in alluvium derived dominantly from limestone and dolomite and some sediment with a high content of lime. Approximately 25 percent of the surface is covered with a desert pavement of pebbles and lime nodules. The surface layer is very pale brown fine sandy loam and gravelly fine sandy loam, approximately 2 to 11 inches thick. The underlying soil units consist of very pale brown fine sandy loam, gravelly sandy clay loam, gravelly loam to very pale brown to white very gravelly sandy clay loam and light brown sandy loam. In some areas of this soil unit, depth to caliche ranges from 3 to 14 inches. Permeability of this soil is moderately slow; available water capacity is very low to moderate; and runoff is slow. The hazard of water erosion is slight, and the hazard of soil blowing is high. This soil is subject to rare periods of flooding during prolonged, high-intensity storms.

SUBSURFACE

Based on results of our subsurface explorations, the subsoils generally consisted of 1 to 3 feet of loose granular soils and soft to firm clays and silts overlying medium dense granular soils, stiff to very stiff clays and silts and moderately hard to hard cemented soils (caliche). The majority of the silts and clays and some sands were found to be porous. The soils also contained varying amounts of soluble gypsum. The depths to the cemented soils are provided below in Table No. 1. Free groundwater was not encountered to the depths explored for this project. Groundwater in the area should be at a depth in excess of 35 feet and should probably not affect the proposed project.

Table No. 1: Depths to Cemented Soils

Boring Location	Depth to Cemented Soils (ft)	Thickness of Cemented Soils (ft)	Soil Description
B-2	19	1½	Hard
B-3*	19	2	Moderately Hard

* From previous investigation

Laboratory test results indicate that the on-site soils have, low to moderate dry densities, a low to moderate shear strength, a low to moderate permeability, a low to high potential for gypsum solubility, a low to moderate clay swell potential, a low chemical (salt) heave potential, and contain sulfate salts in sufficient concentrations to be severely corrosive to concrete, soil cement and metal. The on-site soils should be considered to be moderately to highly susceptible to hydro-collapse. Silts and fine sands are susceptible to piping. Based on the preliminary test results, the native soils can be used as material for soil-cement. The laboratory test results of the native soils presented in Appendix A are summarized in Table No. 2.

Table No. 2: Summary of Laboratory Test Results and Soil Characteristics

Characteristic	Range of Results
Maximum Density	117 to 120 pcf
Optimum Moisture Content	11 percent
Solubility	0.1 to 3.7 percent
Coefficient of Permeability "K"	(1.5 to 3.5) X 10^{-5} cm/sec
Angle of Internal Friction	10 to 39 degrees
Sulfate	0.01 to 0.69 percent
Clay Swell	1 to 7 percent

Based on the results of our subsurface exploration and our experience, variations in the continuity and depth of subsoil deposits should be anticipated. Due to the nature and depositional characteristics of the natural soils, care should be exercised in interpolating subsurface soil conditions beyond the boring and test pit locations.

GEOLOGIC AND SEISMIC CONDITIONS

GEOLOGIC SETTING

The project area is located in the northeastern portion of the Las Vegas Valley, a structural basin of late Mesozoic and Tertiary block faulting origin. The Valley is physiographically characteristic of the Basin and Range Province. Valley deposits are Tertiary and Quaternary Age unconsolidated sediments derived from the surrounding mountains; the local sources of deposition being Frenchman Mountain immediately to the east and areas to the north and northeast such as the Las Vegas Range, Arrow Canyon Range, Dry Lake Range, and the Muddy Mountains. Alluvial deposits consisting of gravel, sand, silt and clay are locally overlain by lacustrine deposits of sand, silt and clay. The alluvial and lacustrine sediments can be up to 4000 feet thick. Coarser-grained alluvial fan deposits are located near the base of the mountains and grade into and interfinger with fine-grained sand, silt and clay deposits toward the central portion of the valley.

The bedrock within Frenchman Mountain and the ranges to the north and northeast of the subject site is predominantly clastic and non-clastic sedimentary rock. The clastic material which comprises the valley fill within the proposed site vicinity is therefore derived from sedimentary rock.

DRAINAGE

Primary drainage for the valley is to the southeast along four major wash systems: the Las Vegas Wash, the Flamingo Wash, the Tropicana Wash and the Duck Creek Wash. The four systems consist of a series of channels of varying lengths and depths which originate along the mountain aprons. The channels drain the valley to the southeast where they all become part of the Las Vegas Wash.

The Range Wash system is a northern tributary of the Las Vegas Wash system. Range Wash is divided into eastern and western tributaries. The eastern tributary system originates in the northeast part of the valley, from Frenchman Mountain to the Las Vegas Range. The western tributary of Range Wash originates exclusively in the Las Vegas Range. The two tributary systems join to form one wash near the intersection of Carey Avenue and Sloan Lane, at the southern end of Nellis Air Force Base. Range Wash empties into Las Vegas Wash near Sloan Lane and Vegas Valley Drive.

CLIMATE

Las Vegas is located in the central portion of a broad desert valley which is almost surrounded by mountains ranging from 2,000 to 10,000 feet higher than the valley floor. The area is arid to semi-arid with an average annual precipitation of less than 5 inches. Most of the rainfall occurs during the winter and in July and August. Strong winds are common, particularly during the spring. Summer typically has maximum temperatures in the 100°F plus range and minimum temperatures are usually between 70° and 75°F. There is usually a period of about two weeks every summer when warm, moist, tropical air predominates and causes scattered thunderstorms (sometimes quite severe) along with higher than average humidity. Severe thunderstorms can cause extensive flooding and soil erosion. Winters are generally mild and pleasant with average daytime temperatures near 60°F and minimum temperatures averaging about 35°F.

GEOLOGIC HAZARDS REVIEW

Existing geologic data, including past CCSW project files and references from the U. S. Soil Conservation Service, U. S. Geological Survey, Nevada Bureau of Mines and Geology, aerial photographs, and information available through the State Universities, were reviewed for the purpose of assessing any known geologic hazard in the vicinity of the subject site. No major geologic hazards were associated with the proposed detention basin site.

Possible recent or active seismic faulting in the vicinity of the proposed Confluence Detention Basin and Sloan Channel include a series of north-northeast striking faults along the west rangefront of Frenchman Mountain, approximately 2 miles to the east of the proposed subject site, east of Hollywood Boulevard. These faults are mapped as mostly inferred and concealed faults by Bell and Price (1991). One north-south striking fault was observed approximately one-half mile east of the subject site but does not appear to project toward the subject site. Also, one inferred northwest striking fault crosses Bonanza Boulevard, approximately 3 miles south of the subject site, west of Hollywood Boulevard and projects toward the Nellis Air Force Base garbage dump, just west of the subject site.

The site is located approximately 2½ miles southwest of a topographic lineation regarded as a compaction fault and 4 to 5 miles north and southwest of mapped fissure zones, as mapped on the Subsidence-Related Faults and Fissures of the Las Vegas Valley Map, published by the Nevada Bureau of Mines and Geology, Subsidence in Las Vegas Valley 1980-91 Final Project Report, John W. Bell and Jonathan G. Price, 1991. It is generally agreed that compaction faults are not bedrock faults, although their displacement may have been at least partly induced by a seismic event. The age of these escarpments have been dated by others at about 14,000 years old. Fissures, surface expressions of differential stress resulting from regional and local subsidence due to withdrawal of groundwater have been localized near compaction faults. Some fissure features were observed at the site. These features are believed to be caused from erosion and not subsidence.

The potential for landslides is believed to be low due to the nature and proximity of the topographic highlands to the project area and low precipitation in the region.

ESTIMATED GROUND ACCELERATIONS

Las Vegas Valley is located in Seismic Zone 2B as categorized in the Uniform Building Code. Zone 2B represents a low to moderately active seismic area. A regional map published by Algermissen and Perkins (1976) presents the expected peak horizontal ground acceleration for the Las Vegas Valley as approximately 0.1g. This value has a 10 percent chance of being exceeded in a 50-year period. Site specific seismicity model analyses have been performed by CCSW on other projects in the Las Vegas Valley. This analysis has typically found the maximum credible peak horizontal ground acceleration to range between 0.2g and 0.3g. For an event having a 10 percent chance of exceedance during a 100-year design life the peak horizontal ground acceleration has ranged between 0.1g and 0.2 g. The peak horizontal ground acceleration recommended for the design of the project is 0.15g.

SITE EVALUATION AND PRELIMINARY RECOMMENDATIONS

GENERAL

Based on (1) our review of published geologic maps; (2) our geologic site reconnaissance; (3) the results of the field and laboratory investigations and (4) our review of the previous preliminary report, it is our opinion that with proper preparation, the site can be utilized for the proposed project. The near surface on-site soils are porous and slightly subject to hydro-collapse. This will probably require overexcavating and recompacting below the embankment and construction of a keyway below the embankment.

The on-site soils are suitable for use as materials for embankment fill and soil-cement. The on-site soils are generally not suitable for use as materials for roller compacted concrete (RCC). The availability of aggregate for RCC, and cobble size material and small boulders for use as riprap appears to be low on site, although commercial gravel pits are located just east of the site. Potential quarry sources for rock riprap are present as bedrock outcrops in the hills east of the project. Based on preliminary slope stability analyses, the planned 2½:1 or 3:1 (horizontal to vertical) slopes for the embankment appear to be stable. The on-site soils consist primarily of fine-grained soils with some interbedded granular materials. The fine-grained soils are porous and potentially hydro-collapsible, have low to moderate strength and low to moderate permeability. The granular soils have high strength and moderate to high permeability. Seepage through and stability of the embankment should not be a concern.

In order to provide geotechnical design recommendations for the proposed project, additional field exploration, laboratory testing and engineering analysis should be performed. The amount of loose, soft and hydro-collapsible surficial soils present on the site and the extent of the cemented soils should be further investigated during the design level geotechnical investigation. The permeability and the corrosion and solubility potentials of the on-site soils should also be further evaluated.

The following sections present an engineering evaluation and preliminary considerations for the proposed site and facility. The preliminary recommendations are for planning and should be confirmed with a final design level investigation.

EMBANKMENT/DIKE SECTION CONSIDERATIONS

A zone of properly placed and compacted structural fill should provide adequate support for the embankment after the surface vegetation and organics have been removed and the foundation preparation has been conducted. We recommend a homogeneous embankment section consisting of on-site soils. The on-site soils are suitable for use as materials for dike embankment fill or other structural fills. It may be necessary to construct a shallow keyway beneath the embankment. The foundation soils beneath the embankment and outside the keyway section will require overexcavation. Due to the clay swell potential of the on-site soils any concrete slabs constructed for project structure will require steel reinforcement.

The preliminary stability analyses indicates that 2½:1 or 3:1 (horizontal to vertical) embankment slopes on both the upstream and downstream faces are stable. The slope stability analyses assumes that all of the exposed embankment surfaces will be adequately protected from erosional forces with either riprap or soil cement. The final thickness of the soil-cement erosion protection layer, should be determined by a qualified hydraulic engineer, after water velocities, and the soil-cement strength and durability characteristics have been determined. The stability of any cut slopes should be analyzed during the final design level investigation.

The preliminary slope stability analyses were performed on the embankment in general accordance with the Nevada State Statutes, Corps of Engineers and the Clark County Regional Flood Control District *Hydrologic Criteria and Drainage Design Manual*. The dike was analyzed with the computer program SB-Slope, Version 3.0. It was used to calculate the minimum factor of safety for three separate cases; (1) sudden drawdown, (2) steady state seepage, and (3) seismic steady state seepage. The SB-Slope program utilizes the simplified Bishop Method of slope stability analysis for circular failure surfaces. Based on laboratory tests, average angles of internal friction of 30 and 28 degrees with no cohesion were used for in-situ and saturated undisturbed native soils. Angles of internal friction of 27 and 25 degrees with 200 pounds per square foot (psf) cohesion were used for unsaturated and unsaturated compacted fill soils, respectively. A pore pressure coefficient (Ru) of 0.5 was used for the sudden drawdown case. The maximum failure surface depth was assumed to be 10 feet below the embankment. A summary of the minimum acceptable factors of safety, and calculated factors of safety is presented on the following table. The results of the slope stability analysis are presented and further explained in Appendix B.

Table No. 3: Calculated and Required Factors of Safety for Slope Stability

Loading Condition	Case	Required[1] F.S.	Calculated F.S.
Sudden Drawdown	1	1.2	1.3
Static-Steady State Seepage	2	1.5	1.6
Seismic-Steady[2] State Seepage	3	1.0	1.3

[1] In accordance with the *Recommended Guidelines for Safety Inspection of Dams* published by the Corps of Engineers (1973).
[2] Seismic evaluation was based on pseudo-static analysis with seismic coefficient of 0.05.

SEEPAGE CONTROL

Based on the fine-grained and relatively impervious nature of the soils present at the site, and a detention time of 36 hours, it appears that seepage through the proposed embankment should not be a problem. We recommend that additional seepage studies be conducted in the final design level investigation. If seepage is a problem, it might be necessary to incorporate an internal drain.

EROSION PROTECTION

Based on the results of our field and laboratory investigations, it is our opinion that the on-site soils will be subject to erosion and/or undercutting due to high water velocities and significant wave action. Therefore, erosion protection will be required for inlet structures, embankment slopes, and along channels. Erosion protection may be provided by soil-cement, roller compacted concrete (RCC), riprap or gabions. Soil-cement or RCC should be 12 to 24 inches thick. However, the soil-cement or RCC thickness should be designed based on water velocity, and strength and durability of the soil-cement or RCC. Soil-cement is not as strong or durable as RCC. Soil-cement is made from adding cement to the on-site soils, while RCC is made from processed aggregate and is basically the

same as Portland Cement concrete. If riprap is used for erosion protection, the riprap rock size and section thicknesses should be designed after flow velocities and wave heights are determined by a hydraulic engineer. If riprap or gabions are used, a puncture-resistant synthetic filter cloth may be required to reduce the amount of scour and piping of natural soils during heavy flows.

OVERFLOW SPILLWAY

The location and type of overflow spillway have not been finalized. The spillway area should be protected from erosion. Alternatives would include concrete slab lining, soil cement or even RCC. The placement of RCC would start from the base of the embankment. The concrete slab lining may require a 4 to 8 inch thick gravel blanket beneath the slabs. The slabs will require reinforcement for clay swell and should be designed to prevent the buildup of hydrostatic pressures behind them.

CHANNELS

The proposed channels may be concrete or soil-cement lined in some sections and grass-lined in others. Due to the porous and expansive nature of the clayey soils, overexcavation and recompaction may be required for the support of channel linings. In the channel areas lined with concrete or soil-cement, permanent unreinforced cut and fill side slopes should be constructed at a minimum ratio of 2:1 (horizontal to vertical). Unreinforced side slopes in the grass-lined areas should be constructed no steeper than 3:1. For steeper channel side slopes, recommendations will be required for slope reinforcement.

CONSTRUCTION CONSIDERATIONS

SITE GRADING

Site grading will generally consist of: (1) the removal of existing vegetation and any rubble, trash or debris from the site; (2) the loose, soft or disturbed native soils should be removed from within the proposed embankment and all other structure areas; (3) the loose or disturbed native soils should be processed and stockpiled for later use as engineered fill; (4) the exposed surficial soils (which are considered porous and hydro-collapsible) will require overexcavation to depths

ranging from 18 to 36 inches, (5) the exposed native soils will require scarification, moisture conditioning and recompaction prior to placing structural fill. Scarification and overexcavation can be terminated where cemented soils are exposed.

The existing on-site soils should be suitable for use as compacted structural fill. There will be shrinkage losses when excavating and compacting the uncemented on-site soils and swell when excavating any cemented soils. The anticipated shrinkage and swell factors for the on-site soils should be determined in the design level investigation.

EXCAVATIONS

Based on observations made during our field explorations, the non-cemented soils should be readily excavatable with conventional earthwork equipment. Partially cemented (moderately hard) to fully cemented (hard) soils were encountered during this and the previous investigation at a depth of 19 feet below the existing ground surface. Heavy-duty ripping, heavy-duty backhoe, headache ball or Ho-ram should be anticipated for any deep excavations. The Contractor should be aware of the potential for vibrational damage to adjacent or nearby structures when using heavy impact equipment during removal of the hard cemented materials.

SOIL CORROSIVITY

Laboratory test results indicate that the on-site soils should be considered corrosive to buried metal and have sulfate levels above that considered harmful to normal strength concrete and soil cement. Consideration should be given to corrosion protection systems for buried metal or the use of PVC. Any concrete and/or soil cement in contact with the on-site soils should contain Type V cement. A soil-cement mix design should be conducted.

FINAL DESIGN RECOMMENDATIONS

Additional design level investigations will be required, when final facility layout and dimensions have been determined. Borings and test pits should be located within and beyond the detention basin and channel alignment to fully evaluate the subsurface conditions. Additional laboratory testing will also be required to further evaluate the nature and engineering properties of the native subsoils. The hydro-collapse potential of the on-site soils and the effects of seepage should be further evaluated.

CLOSURE

Our assumptions, conclusions, recommendations, and opinions presented herein are: (1) based upon the geologic site reconnaissance, (2) based upon our evaluation and interpretation of the findings of the limited field exploration and laboratory programs, (3) based upon an interpolation of soil conditions between and extrapolation beyond the explored locations, (4) based on our geotechnical experience in the locale, (5) subject to confirmation of the conditions encountered during a design investigation, and (6) prepared in accordance with generally accepted professional geotechnical engineering principles and practice. We make no other warranty, either express or implied.

It has been our pleasure to serve you on this project. If you have any questions, please contact this office.

Respectfully submitted,

KEY TO SOILS SYMBOLS AND TERMS

TERMS USED IN THIS REPORT FOR DESCRIBING SOILS ACCORDING TO THEIR TEXTURE OR GRAIN SIZE DISTRIBUTIONS ARE GENERALLY IN ACCORDANCE WITH THE UNIFIED SOILS CLASSIFICATION SYSTEM.

TERMS DESCRIBING CONDITION, CONSISTENCY AND HARDNESS

COARSE GRAINED SOILS (major portion retained on No. 200 sieve): includes (1) clean gravels, (2) silty or clayey gravels and (3) silty, clayey or gravelly sands. *Consistency is rated according to relative density, as determined by laboratory tests.*

Descriptive Term	Relative Density
Very loose	0 to 15%
Loose	15 to 40%
Medium Dense	40 to 70%
Dense	70 to 85%
Very Dense	85 to 100%

FINE GRAINED SOILS (major portion passing No. 200 sieve): Includes (1) inorganic and organic silts and clays, (2) gravelly, sandy or silty clays, and (3) clayey silts. Consistency is rated according to shearing strength as indicated by penetrometer readings or by direct shear tests.

Description Term	Shear Strength (ksf)
Very soft	less than 0.25
Soft	0.25 to 0.50
Firm	0.50 to 1.00
Stiff	1.00 to 2.00
Very stiff	2.00 to 4.00
Hard	4.00 and higher

ROCK: Includes gravels, cobbles, rock, caliche and bedrock materials. Hardness is related to field identification procedures described below.

Descriptive Term	Field Identification Test
Soft	*Can be dug by hand and crushed* by fingers
Moderately hard	Friable, can be gouged deeply with knife and will crumble readily under light hammer blows.
Hard	Knife scratch leaves dust trace, will withstand a few hammer blows before breaking.
Very Hard	Scratched with knife with difficulty, difficult to break with hammer blows.

LEGEND OF LABORATORY TESTS

G-Grain	S-Swell	DS-Direct Shear
A-Liquid & Plastic Limits	*Ch-Chemical*	T-Triaxial
PP-Pocket Penetrometer	N-Chemical Heave	Sol-Solubility
U-Unconfined	C-Consolidation	P-Compaction

SAMPLER TYPES

SIZE PROPORTIONS

Designation	Percent by Weight
Trace	0 to 5
Few	5 to 10
Little	15 to 25
Some	30 to 45

CLASSIFICATION OF SOILS FOR ENGINEERING PURPOSES

ASTM Designation: D 2487 - 90
(Based on Unified Soil Classification System)

			Soil Classification		
Criteria for Assigned Group Symbols and Groups Names Using Laboratory Tests[A]				Group Symbol	Name[B]
Coarse-Grained Soils More than 50% retained on No. 200 sieve	Gravels More than 50% coarse fraction retained on No. 4 sieve	Clean Gravel Less than 5% fines[C]	$Cc \geq 4$ and $1 \leq Cc \leq 3$[E]	GW	Well graded gravel[F]
			$Cu < 4$ and/or $1 > Cc > 3$[E]	GP	Poorly graded gravel[F]
		Gravels with Fines More than 12% fines[C]	Fines classify as ML or MH	GM	Silty gravel[F G H]
			Fines classify as CL or CH	GC	Clayey gravel[F G H]
	Sands 50% or more of coarse fraction passes No. 4 sieve	Clean Sands Less than 5% fines[D]	$Cu \geq 6$ and $1 \leq Cc \leq 3$[E]	SW	Well-graded sand[I]
			$Cu < 6$ and/or $1 > Cc > 3$[E]	SP	Poorly graded sand[I]
		Sands with Fines More than 12% fines[D]	Fines classify as ML or MH	SM	Silty sand[G H I]
			Fines classify as CL or CH	SC	Clayey sand[G H I]
Fine-Grained Soils 50% or more passes the No. 200 sieve	Silts and Clays Liquid limits less than 50	inorganic	PI > 7 and plots on or above "A" line[J]	CL	Lean clay[K L M]
			PI < 4 or plots below "A" line[J]	ML	Silt[K L M]
		organic	$\frac{\text{Liquid limit - oven dried}}{\text{Liquid limit - not dried}} < .75$	OL	Organic clay[K L M N] Organic silt[K L M O]
	Silts and Clays Liquid limit 50 or more	inorganic	PI plots on or above "A" line	OL	Fat clay[K L M]
			PI plots below "A" line	MH	Elastic silt[K L M]
		organic	$\frac{\text{Liquid limit - oven dried}}{\text{Liquid limit - not dried}} < .75$	OH	Organic clay[K L M P] Organic silt[K L M O]
Highly organic soils	Primarily organic matter, dark in color, and organic odor			PT	Peat

[A] Based on the material passing the 3-in. (75-mm) sieve.

[B] If field sample contained cobbles or boulders, or both, add "with cobbles or boulders, or both" to group name.

[C] Gravels with 5 to 12% fines require dual symbols:
GW-GM well-graded gravel with silt
GW-GC well-graded gravel with clay
GP-GM poorly graded gravel with silt
GP-GC poorly graded gravel with clay

[D] Sands with 5 to 12% fines require dual symbols:
SW-SM well-graded sand with silt
SW-SC well-graded sand with clay
SP-SM poorly graded sand with silt
SP-SC poorly graded sand with clay

$$[E] Cu = D_{60}/D_{10} \quad Cc = \frac{(D_{30})^2}{D_{10} \times D_{60}}$$

[F] If soil contains $\geq 15\%$ sand, add "with sand" to group name.

[G] If fines classify as CL-ML, use dual symbol GC-GM, or SC-SM.

[H] If fines are organic, add "with organic fines" to group name.

[I] If soil contains $\geq 15\%$ gravel, add "with gravel" to group name.

[J] If Atterberg limits plot in hatched area, soils is a CL-ML, silty clay.

[K] If soil contains 15 to 29% plus No.200, add "with sand" or "with gravel", whichever is predominant.

[L] If soil contains $\geq 30\%$ plus No. 200, predominantly sand, add "sandy" to group name.

[M] If soil contains $\geq 30\%$ plus No. 200, predominantly gravel, add "gravelly" to group name.

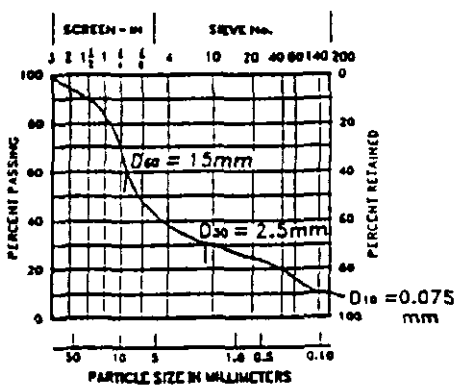
[N] PI ≥ 4 and plots on or above "A" line.

[O] PI < 4 or plots below "A" line.

[P] PI plots on or above "A" line.

[Q] PI plots below "A" line.

SIEVE ANALYSIS



$$C_u = \frac{D_{60}}{D_{10}} \quad \frac{15}{0.075} = 200 \qquad C_c = \frac{(D_{30})}{D_{10} \times D_{60}} = \frac{(2.5)}{0.075 \times 15} = 5.6$$

APPENDIX B

SLOPE STABILITY ANALYSIS

Based on the results of the geologic/seismic evaluation and the field and laboratory investigations, preliminary slope stability analyses of the proposed dike embankment were performed. The stability analyses were conducted in general accordance with the Nevada State Statutes, the Clark County Regional Flood Control District *Hydrologic Criteria and Drainage Design Manual*. The anticipated maximum embankment slope sections were analyzed for three separate cases; (1) sudden drawdown, (2) steady state seepage and (3) seismic steady state seepage. The embankment was analyzed for a height of 22 feet with 19 feet of water. Based on laboratory tests, average angles of internal friction of 30 and 28 degrees with no cohesion were used for in-situ and saturated undisturbed native soils. Angles of internal friction of 27 and 25 degrees with 200 pounds per square foot (psf) cohesion were used for unsaturated and unsaturated compacted fill soils, respectively. A pore pressure coefficient (Ru) of 0.5 was used for the sudden drawdown case. The maximum failure surface depth was assumed to be 10 feet below the embankment. The computer program SB-Slope, Version 3.0, developed by Von Gunten Engineering Software, Inc. was used to calculate the minimum factor of safety for each of the three cases for the embankment. The program utilizes the simplified Bishop Method of slope stability analysis for circular failure surfaces. The computer printouts showing the results of the stability analyses for the maximum anticipated embankment section are also presented in this Appendix. The soil densities shown for each soil number on the computer printouts are as follows: (Soil No. 1) moist undisturbed native soils; (Soil No. 2) saturated undisturbed native soils, (Soil No. 3) compacted embankment fill soils, and (Soil No. 4) saturated compacted embankment fill soils.

Attention: Mr. Walter Hines

Subject: Preliminary Environmental Site Assessment
Sloan Channel/Confluence Basin
Clark County, Nevada

Gentlemen:

We are pleased to submit the results of our Preliminary Environmental Site Assessment conducted at the proposed site of the Sloan Channel/Confluence Basin project located in Clark County, Nevada. The site assessment has consisted of research of readily available documents, review of aerial photographs, site examination, shallow subsurface sampling, and preparation of this report. The study was performed in general accordance with our proposal dated December 12, 1991, and your authorization on March 26, 1992.

Our investigation indicates the site is vacant and undeveloped. No previous site uses with a potential for adverse environmental impact were identified. It is recommended that analysis of impacts to adjacent lands to the west of the subject site be undertaken prior to construction.

If you have any questions concerning information contained in this report, please contact us at your convenience.

Respectfully submitted,

CONVERSE ENVIRONMENTAL CONSULTANTS SOUTHWEST, INC.

for John R. Worlund, P.E.

INTRODUCTION

This report presents the results of our Preliminary Environmental Site Assessment performed at the proposed Range Wash Detention Basin located in Clark County, Nevada. Our study has been conducted in order to determine prior land use, particularly any industrial/chemical activity and its potential environmental impact on the site. Work has been performed in accordance with our contract dated May 4, 1992, and has consisted of:

- Site reconnaissance
- Review of readily available records
- Aerial photograph review
- Soil Sampling
- Laboratory analysis of soil samples
- Preparation of this report

SITE DESCRIPTION

We understand that the site is located in portions of section 10 and 15 of Township 20 South, Range 62 East MDB&M, Clark County, Nevada. The site is currently vacant except for gravel extraction operations in the northern portion.

The site is located in the unincorporated Town of Sunrise Manor. Sunrise Manor covers approximately 32 square miles in the east and the northeast urban area of the Las Vegas Valley. A vicinity map showing the location of the project within the the Vegas area is enclosed as Drawing No. 1. A land use plan is enclosed as Drawing No. 2.

GEOLOGIC AND HYDROGEOLOGIC CONDITIONS

The site is located in the northeast portion of the Las Vegas Valley, an alluvium-filled structural basin. Review of geologic and hydrogeologic conditions from published information and nearby geotechnical investigations conducted by Converse Consultants Southwest, Inc. indicate the local valley fill deposits consist of coarse-grained alluvial deposits and fine-grained playa/lacustrine

(lakebed) deposits that interfinger with occasional wind-blown sand deposits. Soil deposits underlying the site may be at least 2,500, feet thick based on well drillers' logs and contain zones with calcareous cementation and occasional clayey soils.

Two separate aquifers exist in the Las Vegas Valley, a shallow relatively unconfined aquifer and a series of deep, confined water-bearing zones. The majority of the groundwater withdrawn in the Valley is from the deeper aquifer zone and is at depths estimated to be greater than 200 feet at the site. The near-surface groundwater has relatively poor water quality and is occasionally withdrawn in the Valley, principally for irrigation and industrial uses. The near-surface groundwater flow gradient is not well-defined in the area, but is presumed to be southwesterly, toward the lower part of the Valley. Based on public information in the area, shallow groundwater is anticipated at depths of approximately 80 feet below the ground surface.

SITE USE INVESTIGATION

The site use investigation was based on a site reconnaissance, examination of available aerial photographs, review of zoning history for the site, and review of the following agency listings:

- USEPA, National Priorities List (NPL), updated through February, 1991.
- U.S. Environmental Protection Agency (USEPA), Region 9, listing of hazardous waste sites in Clark County, Nevada (CERCLIS), dated October 23, 1991.
- U.S. Environmental Protection Agency SARA Title III Tier 2 Listing obtained from Clark County Fire Department files on March 2, 1992.
- State of Nevada, Division of Environmental Protection (NDEP) Underground Storage Tank Active Case Listing (USTACL), dated July 8, 1991.
- USEPA, Region 9, Resource Conservation and Recovery Act (RCRA) data base list dated November 5, 1991.
- Clark County Health District (CCHD) Underground Storage Tank Owner's and Operator's List (USTOOL), updated March 28, 1991.
- Clark County Fire Department Records (CCFD).

AERIAL PHOTOGRAPH REVIEW

Aerial photographs taken of the Las Vegas area and the vicinity of the subject site were examined for the purpose of tracing the development history of the subject property and immediate vicinity. The aerial photos reviewed were taken in 1950, 1962, 1964, 1968, 1972, 1977,1980, 1983, 1987, and 1990.

1950

The subject site generally appeared undeveloped and in a natural state. Nellis Air Force Base was in place to the northwest of the site along the western border. Nellis Air Force Base was comprised of runways and general support buildings. A sewage treatment plant for Nellis Air Force Base borders the subject property on the west at the southern end of Nellis Air Force Base. Unpaved roads were noted approximately 1/4 mile to the south and west of the subject site. Gravel extraction operations appeared 1/2 mile to the southeast. A vegetated wash appeared on the subject site. It ran diagonally from the northeast boundary to the southwest portion of the site. The closest paved municipal road was Nellis Boulevard, a two lane road.

1962

The site appeared undeveloped and in a natural state. Unpaved roads appeared along the south and eastern boundary of the site. Gravel extraction operations that were previously noted were in place and their boundaries had been greatly expanded. Some homes on estate size lots were being developed southwest of the Nellis Air Force Base site. All other surrounding lands other than Nellis Air Force Base were undeveloped and appeared in a natural state. Some off-road trails appeared traversing the property from east to west and vegetation appears along areas of the natural wash.

1964

The site appeared undeveloped with sparse vegetation. Gravel operations appeared to overlap the subject site on the northern boundary. Nellis Air Force Base golf course appeared to be graded and landscaped. The sewage treatment plant bordering the subject property appeared to have had one

treatment pond removed from operations. One of the base landfills was evident to the west of the sewage treatment plant. To the south of the site approximately 1/4 mile, a residential subdivision was under construction between Lake Mead Boulevard and Carey. Roads had been paved in the subdivision and Lake Mead Boulevard appeared as a paved two lane road.

1968

The area south of the subject was undeveloped with unpaved roads along the southern and eastern boundaries. The site appeared generally unchanged. Nellis Air Force Base to the northwest and the gravel pit operations to the east appeared to be active. The adjacent land use to the south had added additional residential homes. The Nellis Air Force Base golf course appeared to the west of the subject site. The sewage treatment plant appeared to the south of the Nellis Golf course, immediately to the west of the subject site. The base landfill adjacent to the sewage treatment plant west of the subject site appeared to be in operation.

1972

The site appeared vacant and undeveloped. Adjacent land use appeared unchanged on the north, west, and east. To the south of the site, a subdivision had been completed including streets and residential housing. The southwest portion of the site had been graded and preliminary roads had been cut but no paving had ensued. This graded area lies at the southern portion of the subject site.

1977

The site appeared generally unchanged, vacant, and sparsely vegetated. The subdivision to the south of the site appeared completed. The sewage treatment plant to the west of the site appeared reduced in size by the elimination of the two most southern ponds. To the south of the site additional residential housing had begun to appear in a 1/2 mile radius.

1980

Nellis Air Force Base Golf Course appeared fully developed. Sewage treatment pond to the west of the subject site appeared closed. All remaining

sludge ponds appeared inactive. To the south of the subject site, residential development had increased. The graded areas at the southern end of the subject site remained unchanged.

1983

The site appeared undeveloped and vacant. Gravel operations had increased their boundaries of excavation. A large increase of residential development had taken place to the south of the project including single family and multi-family units within a 1/2 mile of the southern boundary. Vegetation had begun to appear in the graded areas in the southern portion of the site. No further development of this area had taken place.

1991

The site appeared generally unchanged and in a natural state. Sparse vegetation appeared on the western section of the site. The surrounding area to the south remains as single and multi-family units. A convenience store had been constructed on the southeast corner of Carey and Mt. Hood. Gravel extraction operations appeared active on the northern and eastern boundaries of the site. Nellis Air Force Base Golf Course appeared fully developed and no evidence of the former sewage treatment plant was noted.

SANBORN MAPS

The Sanborn Map Company maintained fire insurance maps for various cities from 1867 through the 1950s. These maps often identify site uses and features which are not ordinarily available from other sources. The maps generally encompassed a one mile radius from the Court House and offer no information for this assessment.

POTENTIAL OFF-SITE CONTAMINATION GENERATORS

Agency List Review: As of February 1991, the only site in Nevada on the NPL is located 350 miles northwest of Las Vegas in Lyon/Churchill County.

USEPA has a list of potential uncontrolled hazardous waste sites which has been brought to their attention within its Superfund data base. As of October 23,

1991, sites within a one-mile radius of the subject property were included on the list and can be found in Appendix A at the end of this report.

The Emergency Planning and Community Right-to-Know Act was enacted as Title III of Superfund Amendment Reauthorization Act (SARA) in October, 1986. This act requires owners and operators of facilities with specified hazardous substances to give notice to specified state agencies of releases or spills and to comply with other applicable requirements.

CCFD maintains a listing for sites complying with the SARA Title III Tier 2 Regulations. As of the March 2, 1992 list, no sites were listed that are located within 1 mile of the subject site.

NDEP maintains USTACL for reported hydrocarbon spills and leaks. As of July 8, 1991, sites within a one-mile radius of the subject site are included at the end of this report in the Appendix A.

Region 9 of USEPA has also compiled a data base of notifiers complying with the provisions of the RCRA. The notifiers on this list are involved with the storage, treatment, disposal, and/or handling of hazardous waste from their own or other sites/facilities. As of November 5, 1991, RCRA notifiers which can be found within a one-quarter mile radius of the subject site can be found in the Appendix A the end of this report.

CCHD maintains the USTOOL for registered underground storage tanks (USTs) in Clark County, Nevada. As of March 28, 1991, the following facilities which are within a one-half mile radius of the subject site appear on the USTOOL can be found in the Appendix A which appears at the end of this report.

ZONING

According to the Clark County Department of Comprehensive Planning, Zoning Division, at the time of this report, the subject property is designated R-E, Rural Estates. Parcels surrounding the subject site are currently designated with various zoning classifications, as follows:

North:	R-E Rural Estates
Northeast:	R-E Rural Estates
East:	R-E Rural Estates
South	R-T Mobile Home Residential

West: P-F Public Facility
Northwest: P-F Public Facility

A portion of the subject parcel bordering Nellis Air Force Base falls under the Airport Overlay District. This overlay district designates noise levels based upon impacts from military aircraft landing/takeoffs. Noise level designations range from 75 Ldn to 80 Ldn or higher. Ldn is the noise scale most commonly used to measure day-night noise levels. (Ldn mathematically computes time weighted energy related to the source; in this case aircraft type and operation. The results are reduced to noise level contours based upon sound exposure levels.)

According to the Federal Emergency Management Agency Flood Insurance Rate Maps, the site location is designated as Zone X. This zone represents an area which is an area to be determined to be out of the 500 year floodplain.

SITE RECONNAISSANCE

On May 7 1992, we visited the site to determine present use and to identify areas of environmental concern. At the site during our visit, we did not observe obvious evidence of the following:

- Wetland-type areas
- Stained or discolored soil
- Active, inactive or abandoned water wells
- Surficial water run-on to the site
- Process tanks, vats, pits, ponds or lagoons
- Manholes, drainage ditches, culverts or gullies
- UST fill pipes or vent pipes
- Storage tanks or transfer lines
- Roads, tracks, railroad tracks or spurs
- Flowing, standing or ponded liquids other than water
- Absence of vegetation, stressed or dead vegetation
- Hills, mounds, fill piles or unnatural depressions
- Fumes or objectionable odors
- Pollution control equipment

At the site visit we observed evidence of the following:

- General and domestic dumping/debris
- Horizontal depressions, cuts
- Sand and Gravel extraction

During our site reconnaissance we observed evidence of general and domestic debris. Findings included general construction debris, concrete and caliche waste, tires, abandoned furniture and used appliances, and construction tailings mix.

The debris, if disposed of in the proper manner, does not appear to pose an environmental threat to the site. Preliminary road cuts appearing to be an extension of the subdivision to the south of the subject site are evident in the southern portion of the site. These preliminary road cuts are not recent excavations as natural revegetation has occurred. These cuts do not pose an environmental threat to the site.

The Sloan Channel lies on the southwestern boundary of the subject site. The Sloan Channel in this area separates the site from Nellis Air Force Base properties. Nellis Air Force Base Golf Course lies immediately adjacent to the site along the south western boundary. To the south of the subject site is a single family subdivision. The eastern boundary of the site lies adjacent to rural open space. The northern portion of the site contains a sand and gravel extraction operation. Extraction operations appeared to be active with screening in evidence. Gravel extraction operations are a removal process and do not appear to adversely impact the site.

The site, except for areas of dumping and preliminary road cuts, appeared in undisturbed state. Vegetation was abundant and did not appear stressed. The natural extension of Mt. Hood Street became a gravel road at the end of the pavement. Domestic dumping was prevalent along the gravel portion of Mt. Hood Street. When disposed of properly, the domestic dumping/debris should not pose an environmental threat to the site.

Adjacent Lands: Adjacent lands to the west of the subject site have raised a number of concerns. The site known as LF-01 as per Nellis Air Force Base records was reportedly a former base landfill. It was active since 1942, except for a period from 1968 to 1974.

The United States Air Force commissioned a remedial investigation in the late 1989s for 16 designated sites at Nellis Air force Base. Areas of study included the sewage treatment plant percolation ponds adjacent to the base landfill. Monitoring wells and soil borings provided data related to the percolation ponds. The following was reported by JMM regarding the landfill.

All types of solid waste have been reported to have been disposed of in the landfill. Industrial and commercial wastes which may have been disposed include: thinners, paint, solvents such as methyl ethyl ketone (MEK) and trichlorethlene (TCE), waste oil, lubricants, and petroleum. Area fill and trench techniques have been employed at the site (JMM, 1989). The landfill has only been used for the disposal of demolition and construction debris (JMM, 1989).

The groundwater flow direction is southwesterly from the subject site (JMM, 1989). This raises concerns of direct impact arising from the the construction of the detention basin.

These concerns are:

- Potential recharge altering of groundwater levels in the area of the detention basin.
- Raising of the water levels in the area of the former landfill.
- Altering of groundwater flow direction and increasing the gradient through the landfill.

Further, these impacts associated with the potential infiltration related to the subject site may directly affect the adjacent landfill. Infiltration may raise water tables and alter flow direction across the landfill. This may saturate hazardous materials, increase leaching, initiate groundwater flow direction changes, and increase the groundwater gradient. There is potential for increased environmental hazards related to public safety issues by the production of methane gases and or other harmful odors, vapors, or fumes.

Plans to extend construction across the Nellis AFB landfill should be thoroughly investigated for impacts to changes in groundwater levels, flow direction and gradient, and its potential human health risks. Potential hazards associated with construction over an existing landfill need to be investigated.

SUBSURFACE SAMPLING

On May 29, 1992 soil samples were taken from site T-2. The approximate location of this site is shown on Drawing No 2. The samples were taken in conjunction with the concurrent investigation conducted by our affiliate Converse

Consultants Southwest, Inc. Sampling was accomplished by taking a sample from the backhoe bucket using a clean trowel. Soil samples were placed in sampling containers using appropriate protocol and chain of custody procedures. Field vapor readings of volatile organic compounds were monitored in the soil sampling using a photoionization detector (PID). A second soil sample was taken using the same sampling methodology. The samples were sent to an accredited laboratory for analysis. During soil sampling, no unusual soil discolorations odors which may indicate pollutant presence were observed. Anomalous levels of volatile organic compounds were not encountered.

LABORATORY ANALYSIS

Samples were analyzed using EPA Method 8240 and EPA 8015. All results indicated non-detect for Total Petroleum Hydrocarbons (TPH), and non-detect for semi-volatiles which includes most solvents. Results of the laboratory analysis can be found in Appendix B.

CONCLUSIONS AND RECOMMENDATIONS

Our research indicates that the subject site does not have a history of industrial/chemical uses which may have had an adverse environmental impact on the site. The site is located in an area which, until residential and commercial and military installation development located to the south and west of the site, was undeveloped desert. Areas of significant obvious environmental concern were not encountered during our on-site examination. However, with the very close proximity of Nellis Air Force Base Landfill No 1 to the site, the possibility does exist for potential impacts to the groundwater quality and gradient by the completion of this project.

In light of the above discussion, CECSW would recommend analysis of the monitoring well data compiled by the Army Corps of Engineers-Omaha District Nellis AFB, Nevada Final Remedial Investigation Report. In conjunction with this analysis, a hydrological assessment including modeling of the subsurface conditions of the proposed basin and its environs should be conducted to determine potential impacts to adjacent lands.

CLOSURE

This report is for the use of Boyle Engineering as it applies to the proposed Sloan Channel/Confluence Basin project. Its preparation has been in accordance with generally accepted practices in geotechnical engineering, environmental and engineering geology, and hydrogeology. No other warranty, either expressed or implied is made.

This preliminary site assessment should not be regarded as a guarantee that no further contamination beyond that which could be detected within the scope of this investigation is present at the site.

Thank you for the opportunity to be of service. Should you have any questions or comments regarding this report, please do not hesitate to call.

Subject: Additional Environmental Surveys
East Range Wash
Sloan Channel Confluence Basin

Dear Walter:

As you requested, we have assessed the previous studies completed for the Clark County Flood Control District Master Plan. We have reviewed the studies as they pertain to cultural resources, threatened and rare plants and paleontological resources. Additionally, we have discussed the need for additional surveys with Clark County Flood Control District personnel. Based on this review we present the following.

Cultural Resources

Cultural resource analysis includes an overview of three types of resources: historical, archaeological and ethnographic resources. For the purposes of this report, the findings described in the Clark County Regional Flood Control District Draft Environmental Impact Statement (DEIS) for the proposed sites will be summarized.

Cultural resources, specifically archeological sites, provide information about past societies. Physical evidence found during these studies are the only form of record of these societies. Ethnographic resources include sites which are of current importance to Native American groups for religious reasons and the preservation of heritage.

According to surveys completed in the DEIS for the Northern Las Vegas Valley, the proposed Confluence Basin does not fall in an area of high sensitivity. Nearby Sunrise and Frenchman Mountains are considered areas of religious significance and rated as exclusionary areas. The Las Vegas Colony, a Paiute Indian reservation, is located approximately five miles to the north of the subject. It is considered to be of moderate sensitivity level.

Converse Environmental Consultants Southwest, Inc.
4670 South Polaris Avenue
Las Vegas, Nevada 89103-5615
Telephone (702) 739-8811
Facsimile (702) 798-0098

The proposed Confluence Basin does not directly impact these known sites. Further study would be required to determine the indirect impacts of flow channels or other appurtenances related to the Confluence Basin. The Colony is located over 10 miles to the north of the site. Sunrise and Frenchman Mountains are located to the east of the site. The Old Arrowhead Road, an historic trail located to the northeast of the site, is considered to be of moderate sensitivity. No specific impacts related to these sites are expected to the Confluence Basin project area. A literature review to determine sensitivity levels would be required to determine the need for further site specific studies.

Rare and Threatened Species

Plants:

According to preliminary surveys conducted for the DEIS, no federally listed species are expected to occur in the area of the Confluence Basin. A state listed specie known as the golden bear poppy, *Arctomecon californica*, has been identified five miles north of Nellis Air Force Base. No impacts are expected related to the construction of Confluence Basin based on existing inventories as provided in the DEIS. A complete on-site survey by trained botanists would be necessary to verify the existing data.

Wildlife:

A review of the Biological Assessment prepared for U.S. Fish and Wildlife Service identifies the Northern Las Vegas Valley as containing sensitive biological resources. The DEIS identifies a survey methodology for Desert Tortoise and other sensitive species. In discussions with Clark County Flood Control District personnel, biological resource issues will be assessed in accordance with the Biological Opinion and Short Term Habitat Conservation Plan as adopted in compliance with the Endangered Species Act. Compliance with the Short Term Habitat Conservation Plan will require surveys 90 days prior to construction grading.

Paleontological Resources

Paleontological resources were not originally identified in the DEIS. A complete paleoentological assessment is currently underway for Clark County Flood Control District by San Bernardino County Museum personnel. It is anticipated these will be complete by September, 1992.

Conclusions

The conclusions regarding additional surveys in relation to the Sloan Channel/Confluence Basin have been summarized from the initial data and reports compiled for the preparation of the DEIS. This firm and their

respective resource specialists have not conducted surveys for a complete evaluation of the proposed site for a formal opinion on the aforementioned resources. This overview has been compiled from existing data sources related to the Clark County Flood Control District Master Plan. The DEIS contains specific mitigation measures related to the resources which may be impacted by the implementation of the plan. It is recommended that consultation be initiated with the lead agency which oversees the compliance with the DEIS and Clark County Flood Control District. The consultation process would review the mitigation measures outlined in Sections 14 and 15 and their effects on the proposed Sloan Channel/Confluence Basin.

We appreciate the opportunity to be of service to your work regarding the Sloan Channel/Confluence Basin project. If you have questions or comments regarding this overview, please contact the undersigned.

Sincerely;

CONVERSE ENVIRONMENTAL CONSULTANTS SOUTHWEST, INC.

August 4, 1992 91-33647-01

Boyle Engineering Corporation
1785 East Sahara Avenue, Suite 300
Las Vegas, NV 89104

Attention: Mr. Walter Hines, P.E.

Subject: Impact on Groundwater
Sloan Channel/Confluence Detention Basin
Near Nellis Air Force Base
Clark County, Nevada

Gentlemen:

This letter is in response to our discussions with you concerning the Nellis Air Force Base Landfill and its potential impact to the groundwater quality and gradient by the completion of the Sloan Channel/Confluence Detention Basin project. Converse Consultants Southwest, Inc. performed a Preliminary Geotechnical and Geologic Investigations for the subject project. Our report (draft) dated July 14, 1992 (CCSW Project No. 91-33647-01) presented our findings and recommendations. Converse Environmental Consultants Southwest, Inc. performed a Preliminary Environmental Site Assessment for the project. Their report dated July 9, 1992 (CECSW Project No. 92-43281-01) presented their findings and recommendations.

Based on our review of laboratory test results and our understanding of the project, it is our opinion that the water stored in the detention basin will not infiltrate into the landfill provided the following:

a. The maximum detention time and water level at full reservoir of the detention basin does not exceed 36 hours and 20 feet, respectively.

b. The permeability of the native on-site soils is low. The permeability tests conducted on remolded on-site soils were found to be low (1×10^{-5} cm/sec).

c. The groundwater elevation is not shallower than 60 feet. It appears that groundwater is at an elevation of 80 feet below the existing ground surface.

d. The limits of the landfill are not within 200 feet of the detention basin. Based on our review of available air photos, it appears that the old landfill is greater than 200 feet from the basin embankment centerline.

Converse Consultants Southwest, Inc.
4670 South Polaris Avenue
Las Vegas, Nevada 89103-5615
Telephone (702) 795-2121
Facsimile (702) 798-0098

With the anticipated low permeability of the on-site soils, the short detention time, the depth to groundwater and the distance of the old landfill from the basin, it appears that water detained from the embankment will not influence the old landfill and the existing groundwater quality.

It has been our pleasure to be of continued service to you on this project. If you have any questions, please contact this office.

Respectfully submitted,

CONVERSE CONSULTANTS SOUTHWEST, INC.

```

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

Table 6.3A.—Local-storm PMP computation, Colorado River, Great Basin and California drainages. For drainage average depth PMP. Go to table 6.3B if areal variation is required.

Drainage CONFLUENCE DETENTION Area 82.4 (mi²) (km²)
Latitude 37 Longitude 115 Minimum Elevation 2125 ft (m)

Steps correspond to those in sec. 6.3A.

1. Average 1-hr 1-mi² (2.6-km²) PMP for drainage [fig. 4.5]. 10.5 in. (cm)

2. a. Reduction for elevation. [No adjustment for elevations up to 5,000 feet (1,524 m): 5% decrease per 1,000 feet (305 m) above 5,000 feet (1,524 m)]. 100 %

   b. Multiply step 1 by step 2a. 10.5 in. (cm)

3. Average 6/1-hr ratio for drainage [fig. 4.7]. 1.32

	Duration (hr)								
	1/4	1/2	3/4	1	2	3	4	5	6
4. Durational variation for 6/1-hr ratio of step 3 [table 4.4].	74	89	95	100	114	121	125	128	130 %
5. 1-mi² (2.6-km²) PMP for indicated durations [step 2b X step 4].	7.8	9.3	10.0	10.5	12.0	12.7	13.1	13.4	13.7 in. (mm)
6. Areal reduction [fig. 4.9].	55	63	67	69	72	75	77	78	79 %
7. Areal reduced PMP [steps 5 X 6].	4.3	5.9	6.7	7.2	8.6	9.5	10.1	10.5	10.8 in. (mm)
8. Incremental PMP [successive subtraction in step 7].				7.2	1.4	0.9	0.6	0.4	0.3 in. (mm)
	4.3	1.6	0.8	0.5	} 15-min. increments				

9. Time sequence of incremental PMP according to:

Hourly increments [table 4.7].	0.4	0.9	7.2	1.4	0.6	0.3	in. (mm)
Four largest 15-min. increments [table 4.8].	4.3	1.6	0.8	0.5			in. (mm)

SOLUTION FOR A RECTANGULAR CHANNEL

OUTLET CHANNEL

DISCHARGE	1300.00 CFS	BASE WIDTH	38.00 FEET
VELOCITY	9.35 FPS	SIDE SLOPE	0.00 TO 1
NORMAL DEPTH	3.66 FEET	AREA	139.00 SQ.FT.
BOTTOM SLOPE	0.00200	TOP WIDTH	38.00 FEET
MANNING'S N	0.0150		
CRITICAL DEPTH	3.31 FEET	VELOCITY HEAD	1.36 FEET
FROUDE NUMBER	0.86	P + M	39447 POUNDS
CRITICAL SLOPE	0.00272		

SOLUTION FOR A TRAPEZOIDAL CHANNEL

OUTLET CHANNEL ALTERNATIVE 2

DISCHARGE	970.00 CFS	BASE WIDTH	20.00 FEET
VELOCITY	8.66 FPS	SIDE SLOPE	2.00 TO 1
NORMAL DEPTH	4.00 FEET	AREA	112.03 SQ.FT.
BOTTOM SLOPE	0.00180	TOP WIDTH	36.00 FEET
MANNING'S N	0.0150		
CRITICAL DEPTH	3.67 FEET	VELOCITY HEAD	1.17 FEET
FROUDE NUMBER	0.87	P + M	28943 POUNDS

Project CONFLUENCE DET BASIN Description

Job No. LV-C07-250-07 SHEET /

By DWI Date Chkd.By Date

DIVERSION STRUCTURE

SPATIALLY VARIED FLOW WITH DECREASING DISCHARGE BY NUMERICAL INTEGRATION USING FOLLOWING EQUATION:

CHANGE IN DEPTH = MOMENTUM LOSS + ENERGY LOSS

$$\Delta y = dy_C = \frac{\alpha Q_1 (V_1 + V_2) \Delta V}{g (Q_1 + Q_2)} \left(1 - \frac{\Delta Q}{2Q_1}\right) + S_f \Delta x$$

"OPEN CHANNEL HYDRAULICS", CHOW EQU. (12-40)

OR

$$\Delta y = dy_C = dy_m + h_f$$

$$\Delta y = dy_T = HGL_2 - HGL_1$$

TRIAL & ERROR BALANCE $dy_C = dy_T$

SIMILAR INCREASING FLOW

$$\Delta y = \frac{\alpha Q_1 (V_1 + V_2)}{g (Q_1 + Q_2)} \left(\Delta V + \frac{V_2}{Q_1} \Delta Q\right) + S_f \Delta x$$

EQU. (12-38)

SPILLWAY CALCULATIONS

Project CONEWENCL
Job No. LV-CW7-250-02
By DWD Date ____ Chkd.By ____ Date ____
Description ____
SHEET /

EMERGENCY SPILLWAY.

SOIL CEMENT BROAD CRESTED WEIR

$Q = 3Lh^{3/2}$

L = 2200' FULL LENGTH OF WEST EMBANKMENT PER CCRFCD & COUNTY

PMF Q = 74,000 cfs

$h = \left(\frac{Q}{3L}\right)^{2/3} = 5'$

USE 5' MAX HEAD DESIGN
ASSUME FLOW THROUGH GOLF COURSE NORTH OF SPILLWAY INEFFECTIVE AND NEGLIGIBLE

SCOUR DEPTH PLUNGE POOL IN SANDY SOILS = 1/2 SEQUENT DEPTH
CONSERVATIVELY USE MIN DEPTH OF 1/2 SEQUENT DEPTH + 2' FOR CUTOFF
NOTE: NATURAL SOILS ARE MORE RESISTENT THAN SAND

REFERENCE: "DESIGN GUIDELINES & CRITERIA CHANNELS & HYDRAULIC STRUCTURES ON SANDY SOIL", SIMONS, LI & ASSOCIATES, JUNE 1981

DETERMINE SEQUENT DEPTH DEPENDING ON HEIGHT OF DROP
q = 34.5 cfs / ft

$\sigma_{max} = \frac{7912 \text{ lb}}{6 - 2(.49)} = 1576 \text{ psf}$

$\sigma_{max} < \sigma_a$ OK

ALLOWABLE SHEAR

$T_a = N \tan \phi^* / B + c_g$

$\phi^* = 25\gamma_g - 10°$ γ_g - t/m³

$\phi^* = 25(1.66) - 10 = 31.5$

c_g = say 1.5 t/m² (1.5 to 4 typical)

$N/B = \frac{7912 \text{ lb}}{6'} = 1319 \text{ psf} \left(\frac{.00482 \text{ t/m}}{\text{psf}}\right) = 6.43 \text{ t/m}^2$

$\tau_a = 6.43\ t/m^2 \tan 31.5° + 1.5 = 5.44\ t/m^2$

$\tau_a = 5.44\ t/m^2 \left(204.8 \frac{psf}{t/m^2}\right) = 1115\ psf$

MAXIMUM STRESS

$\tau = \frac{T}{B}$

$T = (W + P_V)\sin 6° + P_H \cos 6°$

$T = (6499 + 1178)\sin 6° + 2647 \cos 6° = 3435\ lb$

$\tau = \frac{3435\ lb}{6'} = 572\ psf$

$\tau = 572 < t_a = 1115$ OK

Attention: Mr. Don Davis, P.E.

Subject: Final Design Geotechnical Investigation
Sloan Channel/Confluence Detention Basin
Near Nellis Air Force Base
Clark County, Nevada

Gentlemen:

We are pleased to submit the results of our final design geotechnical investigation conducted for the Sloan Channel/Confluence Detention Basin project located near Nellis Air Force Base in Clark County, Nevada. The study was performed in general accordance with our signed Standard Form of Agreement with Consultant for Professional Services, dated May 4, 1992.

The detention basin embankments may be constructed from on-site borrow soils. Foundation systems consisting of conventional spread footings founded on a properly placed and compacted zone of structural fill are recommended for support of structural loads.

Groundwater was not encountered to the depths explored for this project. Hard caliche and/or moderately hard partially cemented soils were encountered at some of the boring locations at various depths. Rock excavation techniques may be required for any areas with deep cuts.

The report which follows presents our recommendations for design and construction of earth structures and foundations. If you have questions concerning information contained in this report, please contact us at your convenience.

Respectfully submitted,

CONVERSE CONSULTANTS SOUTHWEST, INC.

Algirdas G. Leskys, P.E.

IMPORTANT INFORMATION ABOUT YOUR GEOTECHNICAL ENGINEERING REPORT

As the client of a consulting geotechnical engineer, you should know that site subsurface conditions cause more construction problems than any other factor. ASFE/The Association of Engineering Firms Practicing in the Geosciences offers the following suggestions and observations to help you manage your risks.

A GEOTECHNICAL ENGINEERING REPORT IS BASED ON A UNIQUE SET OF PROJECT-SPECIFIC FACTORS

Your geotechnical engineering report is based on a subsurface exploration plan designed to consider a unique set of project-specific factors. These factors typically include: the general nature of the structure involved, its size, and configuration; the location of the structure on the site; other improvements, such as access roads, parking lots, and underground utilities; and the additional risk created by scope-of-service limitations imposed by the client. To help avoid costly problems, ask your geotechnical engineer to evaluate how factors that change subsequent to the date of the report may affect the report's recommendations.

Unless your geotechnical engineer indicates otherwise, do not use your geotechnical engineering report:

- when the nature of the proposed structure is changed, for example, if an office building will be erected instead of a parking garage, or a refrigerated warehouse will be built instead of an unrefrigerated one;
- when the size, elevation, or configuration of the proposed structure is altered;
- when the location or orientation of the proposed structure is modified;
- when there is a change of ownership, or
- for application to an adjacent site.

Geotechnical engineers cannot accept responsibility for problems that may occur if they are not consulted after factors considered in their report's development have changed.

SUBSURFACE CONDITIONS CAN CHANGE

A geotechnical engineering report is based on conditions that existed at the time of subsurface exploration. Do not base construction decisions on a geotechnical engineering report whose adequacy may have been affected by time. Speak with your geotechnical consultant to learn if additional tests are advisable before construction starts. Note, too, that additional tests may be required when subsurface conditions are affected by construction operations at or adjacent to the site, or by natural events such as floods, earthquakes, or ground water fluctuations. Keep your geotechnical consultant apprised of any such events.

MOST GEOTECHNICAL FINDINGS ARE PROFESSIONAL JUDGMENTS

Site exploration identifies actual subsurface conditions only at those points where samples are taken. The data were extrapolated by your geotechnical engineer who then applied judgment to render an opinion about overall subsurface conditions. The actual interface between materials may be far more gradual or abrupt than your report indicates. Actual conditions in areas not sampled may differ from those predicted in your report. While nothing can be done to prevent such situations, you and your geotechnical engineer can work together to help minimize their impact. Retaining your geotechnical engineer to observe construction can be particularly beneficial in this respect.

A REPORT'S RECOMMENDATIONS CAN ONLY BE PRELIMINARY

The construction recommendations included in your geotechnical engineer's report are preliminary, because they must be based on the assumption that conditions revealed through selective exploratory sampling are indicative of actual conditions throughout a site. Because actual subsurface conditions can be discerned only during earthwork, you should retain your geotechnical engineer to observe actual conditions and to finalize recommendations. Only the geotechnical engineer who prepared the report is fully familiar with the background information needed to determine whether or not the report's recommendations are valid and whether or not the contractor is abiding by applicable recommendations. The geotechnical engineer who developed your report cannot assume responsibility or liability for the adequacy of the report's recommendations if another party is retained to observe construction.

GEOTECHNICAL SERVICES ARE PERFORMED FOR SPECIFIC PURPOSES AND PERSONS

Consulting geotechnical engineers prepare reports to meet the specific needs of specific individuals. A report prepared for a civil engineer may not be adequate for a construction contractor or even another civil engineer. Unless indicated otherwise, your geotechnical engineer prepared your report expressly for you and expressly for purposes you indicated. No one other than you should apply this report for its intended purpose without first conferring with the geotechnical engineer. No party should apply this report for any purpose other than that originally contemplated without first conferring with the geotechnical engineer.

GEOENVIRONMENTAL CONCERNS ARE NOT AT ISSUE

Your geotechnical engineering report is not likely to relate any findings, conclusions, or recommendations

INTRODUCTION

GENERAL

This report presents the results of our final design geotechnical investigation performed for the proposed Sloan Channel/Confluence Detention Basin Project in Clark County, Nevada. A vicinity map showing the location of the project within the Las Vegas Valley area is provided on Drawing No. 1. The purposes of this investigation were to:

1. Determine the nature and engineering properties of the subsurface and embankment fill soils;
2. Provide recommendations for earthwork requirements; and
3. Provide geotechnical design recommendations for the proposed detention basin and hydraulic structures.

This study was performed in conjunction with an environmental investigation (CECSW Project No. 93-43109-01).

In 1992, Converse Consultants Southwest, Inc. (CCSW) conducted a preliminary geotechnical site assessment for the subject project (CCSW Project No. 91-33647-01, dated July 12, 1992). Data from that investigation was referenced during our study. In 1989, CCSW also performed a Preliminary Geotechnical Evaluation for Facility Planning Upper Las Vegas Flood Control Projects in North Las Vegas (CCSW Project No. 88-33195-01). Our report, dated November 20, 1989, presented our findings and preliminary recommendations. The proposed project lies within the limits of this investigation. The detention basin will be located near the site referred to as *Potential Detention Site 1*. Pertinent boring and trench logs from the previous investigations are provided in Appendix C. The approximate location of the previous borings and trenches are indicated on Drawing No. 2.

PROJECT DESCRIPTION

We understand the project will consist of embankments and a reservoir with emergency overflow spillway, outlet works, and inlet and outlet channels. One of the embankments will serve as the emergency spillway. The spillway embankment will trend from south to north along the west end of the reservoir and will be approximately 2,200 feet in length. For erosion protection, a soil-cement surface is planned on the crest and on the 2:1 (horizontal to vertical) downstream slope. The upstream slope will have a 4:1 (horizontal to vertical) slope. The maximum upstream and downstream spillway embankment heights will be on the order of about 16 feet and 12 feet, respectively. A typical cross section of the proposed spillway embankment is presented on Figure No. 1. The earthen embankment will trend from west to east along the southern end of the reservoir. The maximum upstream and downstream earthen embankment heights will be on the order of about 23 feet and 16 feet, respectively, with a crest width of about 20 feet. A 4:1 (horizontal to vertical) slope is planned for both sides of the earthen (south) embankment. The maximum height of both embankments will be near the southwest corner of the reservoir. Their heights will gradually decrease to a minimal height as they trend toward their opposite ends (north and east). The inlet and outlet channels will be about 4,000 and 2,400 feet in length, respectively. The existing Sloan Channel alignment west of the Nellis Air Force Base golf course will be diverted from a southerly direction to an easterly direction (inlet channel) across the golf course to the detention basin area. The inlet channel will generally have 3:1 side slopes and will be unlined in some areas and grass-lined in others. The grass-lined areas will have flatter side slopes. Some unlined channel areas may use gabions or other erosion control measures. The outlet channel will be concrete lined with 2:1 side slopes. The embankments and reservoir will be located just east of the golf course. In the reservoir area, excavations are anticipated to be on the order of 6 to 8 feet. The detention basin will cover an area of about 150 acres and will have a maximum holding time of about 36 hours. When the reservoir is full and half full, the water levels will be about 16 feet and 13 feet deep, respectively. Seepage losses from the facility are not a concern, as long as stability of the structure is adequate and downstream development is not affected. Erosion protection alternatives include gabions and soil-cement. We were requested to evaluate two soil types (fine-grained & granular) for potential use as material for

soil cement. The report (CCSW Project No. 93-33131-01) presenting the results of that study, will be provided at a later date.

A prefabricated concrete bridge/culvert (Con/Span) is planned near the Sloan Channel diversion area. It will bridge across the new inlet channel and will be placed in the existing alignment of the road to the golf course clubhouse. The Con/Span structure will be five section panels wide (40 feet) and double spanned. Each span will be 24 feet with a rise of 8 to 10 feet. The structure will have 3 feet of cover. The anticipated maximum abutment and pier loads with HS20 loading were estimated to be about 13 kips per lineal foot (klf) and 23 klf, respectively. The channel underlying the structure will be lined with a one-foot thick gabion blanket. Formed concrete wingwalls will also be placed adjacent to the Con/Span structure. Wingwall footings will be at the same elevation as the abutment footings. The anticipated maximum water velocity at the Con/Span location is 10 feet per second (fps).

Two 12 foot wide prefabricated steel bridges with wood decking will cross the inlet channel in the golf course area. The bridges will be single span and will be about 60 and 120 feet long. They will be used for golf carts and maintenance vehicles.

The outlet works will consist of a box type structure located near the southwest corner of the reservoir. The box structure will be about 20 X 50 feet in size. The top of the box will be open at elevation 1813 and will serve as the main inlet of the outlet works. A smaller inlet consisting of a 5 X 4 foot reinforced concrete box (RCB) covered with a trash rack will be at the bottom of the upstream slope. Two 10 X 5 foot RCB's will extend through the earthen embankment to connect the outlet channel with the box structure.

SCOPE OF SERVICES

The following tasks were included in our scope of services:

1. A field exploration program was conducted which consisted of drilling and excavating, logging, and sampling of thirty-six (36) exploratory borings to depths ranging from 10 to 40 feet and twelve (12) exploratory test pits to depths varying from 5 to 6 feet. The

approximate location of the explorations are shown on Drawing No. 2. A description of the equipment and procedures used during the exploration program is presented in Appendix A. Summaries of the boring logs are also presented in Appendix A. General summaries of the exploratory test pits are presented in Appendix A. Samples of the subsurface soils were obtained from the borings and test pits, and were taken to our laboratory for further evaluation and testing. The samples obtained from the test pits were generally for the soil-cement mix design.

2. Laboratory tests were conducted on selected soil samples. Tests included moisture content, dry densities, permeability, solubility, clay swell, Atterberg limits, chemical analyses, maximum density, sieve analyses, and direct shear tests. Descriptions and results of the laboratory tests are presented in Appendix A. The soil samples presently stored in our laboratory will be discarded after 30 days, unless this office receives a specific request to retain the samples for a longer period.

3. Results of the field exploration and laboratory testing were evaluated and engineering analyses were performed to develop appropriate recommendations for the design and construction of the proposed project.

4. This geotechnical report was prepared to present the findings, conclusions and recommendations of this firm.

SITE CONDITIONS

SURFACE

At the time of our field investigation, the site was generally undeveloped. The area of the unlined inlet channel was generally developed with a golf course and some paved roads. The west end of the proposed inlet channel area was undeveloped desert with vegetation typical for the area. The detention basin area was generally undeveloped desert that was sparsely vegetated with

creosote and bursage. Scattered mesquite bushes were encountered near or in wash channels. The ground surface toward the west was covered with occasional very small "sand dunes" covered with vegetation. Two small to medium-sized washes flow south and southwest, through the proposed detention basin area and join near the center and then flow southwest off the site to an unlined channel that ties into the existing concrete lined Sloan Channel at Carey Avenue. The existing unlined channel will be concrete lined for this project and will be a part of the concrete lined outlet channel. The two washes range in size from approximately 10 to 30 feet across. The flow grades of the these washes are gentle and fairly uniform through the area, averaging about a 10 foot vertical drop over 1000 feet horizontally. Areas between the washes are generally flat, with occasional refuse piles. The northeast section of the proposed detention basin is an old gravel pit borrow area. The southern boundary of the gravel pit is lined with large fill piles. Large power transmission lines trend along the southern boundary of the detention basin just south of the proposed south embankment. The alignment of the transmission lines changes directions near the southwest corner of the reservoir and trends to the south along the proposed outlet channel alignment. The alignment of the outlet channel is undeveloped desert toward the north and is developed as indicated on Drawing No. 2 towards the south near the existing Sloan Channel. The developed area is unlined and is bordered on the east by a paved street (Toiyabe Street). The detention basin area is bounded on the North and West by Nellis Air Force Base, on the east and south by undeveloped desert.

SUBSURFACE

Based on results of our subsurface explorations, the subsoils generally consisted of 1 to 5 feet of soft to firm clays and silts and loose granular soils overlying stiff to very stiff clays and silts, medium dense granular soils, and moderately hard to hard cemented soils (caliche). The majority of the silts and clays and some sands were found to be porous. As indicated on Drawing No. 2, the granular soils were generally encountered towards the east and southeast portions of the site except for the surficial dune sands towards the west. The soils also contained varying amounts of soluble gypsum. The depths to the cemented soils are provided below in Table No. 1.

Free groundwater was not encountered to the depths explored for this project. Groundwater in the area should be at a depth in excess of 40 feet and should probably not affect the proposed project.

Table No. 1: Depths to Cemented Soils

Boring Location	Depth to Cemented Soils (ft)	Thickness of Cemented Soils (ft)	Soil Description
B-112	21	5	Moderately Hard
B-113	2	8	Moderately Hard
B-113	19	8	Moderately Hard
B-114	4	>11	Moderately Hard
B-115	6	7	Moderately Hard
B-116	10	2	Moderately Hard
B-118	5	>10	Moderately Hard
B-133	1½	4	Moderately Hard
B-133	5½	1	Hard
B-134	5	3	Moderately Hard
B-135	6	1	Moderately Hard
B-2*	19	1½	Hard
B-3**	19	2	Moderately Hard

* From preliminary geotechnical site assessment (CCSW Project No. 91-33647-01, dated July 12, 1992).

** From preliminary geotechnical evaluation (CCSW Project No. 88-33195-01, dated November 20, 1989).

Laboratory test results indicate that the on-site soils have, low to moderate dry densities, a moderate to high potential for hydro-collapse (rapid settlement upon saturation), moderate shear strength, low to moderate permeability, a low to moderate potential for gypsum solubility, a low to high clay swell potential, a low chemical (salt) heave potential, and contain sulfate salts in sufficient concentrations to be severely corrosive to concrete, soil-cement and metal. Silts and fine sands are susceptible to piping. Based on the preliminary soil-cement test results, the native soils can be used as material for soil-cement. The laboratory test results of the native soils presented in Appendix A are summarized in Table No. 2.

Table No. 2: Summary of Laboratory Test Results and Soil Characteristics

Characteristic	Range of Results
Maximum Density	117 to 121 pcf
Optimum Moisture Content	11 to 11.5 percent
Solubility	0.1 to 4.6 percent
Coefficient of Permeability "K"	(1.5 to 35) X 10^{-6} cm/sec[2]
Angle of Internal Friction	18 to 39 degrees
Sulfate	0.01 to 0.69 percent
Clay Swell	1 to 10 percent

[2]Remolded Soils

Based on the results of our subsurface exploration and our experience, variations in the continuity and depth of subsoil deposits should be anticipated. Due to the nature and depositional characteristics of the natural soils, care should be exercised in interpolating subsurface soil conditions beyond the boring and test pit locations.

LOCAL FAULTING

No bedrock or tectonic faults are known to transect the lakebed deposits in the area of the project. The nearest fault with evidence of possible geologically recent displacement is located at the foot of Frenchman's Mountain approximately 1 mile east of the site.

The site is located approximately 1½ miles southeast of a topographic lineation regarded as a subsidence-related fault and 5 miles southeast of a mapped fissure zone, as mapped on the Subsidence-Related Faults and Fissures of the Las Vegas Valley Map, published by the Nevada Bureau of Mines and Geology, Subsidence in Las Vegas Valley 1980-91 Final Project Report, John W. Bell and Jonathan G. Price, 1991. It is generally agreed that subsidence-related faults are not bedrock faults, although their displacement may have been at least partly induced by a seismic event. The age of one of these escarpments has been dated by others at about 14,000 years old. Fissures, surface expressions of differential stress resulting from regional and local subsidence due to withdrawal of groundwater have been localized near subsidence-related faults.

Some fissure features were observed at different locations across the site. These features are believed to be related to erosion and/or hydro-collapsible soils and not subsidence.

ESTIMATED GROUND ACCELERATIONS

Las Vegas Valley is located in Seismic Zone 2B as categorized in the Uniform Building Code. Zone 2B represents a low to moderately active seismic area. A regional map published by Algermissen and Perkins (1976) presents the expected peak horizontal ground acceleration for the Las Vegas Valley as approximately 0.1g. This value has a 10 percent chance of being exceeded in a 50-year period. Site specific seismicity model analyses have been performed by CCSW on other projects in the Las Vegas Valley. This analysis has typically found the maximum credible peak horizontal ground acceleration to range between 0.2g and 0.3g. For an event having a 10 percent chance of exceedance during a 100-year design life the peak horizontal ground acceleration has ranged between 0.1g and 0.2 g. The peak horizontal ground acceleration recommended for the design of the project is 0.15g.

EVALUATION AND RECOMMENDATIONS

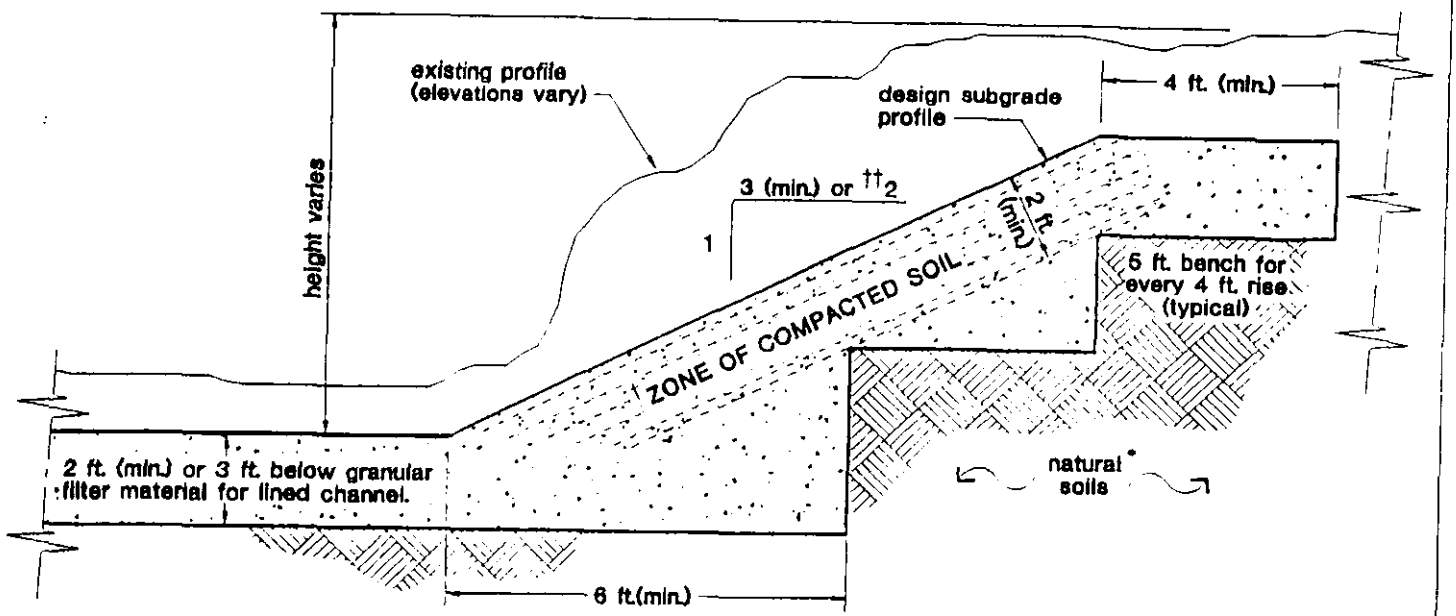
GENERAL

Based on the results of the field and laboratory investigations, it is our opinion that the detention basin embankments may be constructed from on-site borrow soils. The borrow soils should have low permeabilities. A few borrow areas have soils that are low to moderately water soluble (gypsiferous) and may require blending with other on-site or import soils prior to being used as embankment or structural fill. Stability of the embankments should not be a concern if the planned 4:1 (horizontal to vertical) upstream slopes and the 4:1 and 2:1 (spillway) downstream slopes are used. The planned channel side slopes for the unlined (3:1) and concrete lined (2:1) channels should be stable. The native soils in their present condition are subject to hydro-collapse and are not considered suitable for the support of the proposed structures and asphaltic pavements. They could also cause embankment settlement if proper preparation of subgrade soils is not accomplished. The engineering properties of the on-site

soils can be improved by excavating, processing and recompacting. The proposed structures should receive adequate support from conventional footings founded on a zone of properly placed and compacted structural fill. Hydro-collapsible soils were encountered at depth, to help reduce future maintenance due to runoff erosion and settlement, the hydro-collapsible soils should be overexcavated or reworked and recompacted in the unlined channel and detention basin bottom areas. On-site soils with a solubility greater than 2 percent (gypsiferous) may require blending with non-gypsiferous soils prior to being reused as compacted structural fill. Potential sources of cobbles for gabion construction are the gravel pits east of the project. Occasional use of rock excavation techniques for cemented soils should be anticipated for some areas of the project.

EARTHWORK

Site Preparation: Within the areas to be graded, we recommend that all the existing vegetation, undocumented fill, rubble, trash, debris and any loose soft or disturbed native soils should be removed from within the proposed embankment, channel, inlet (diversion) and outlet structure and bridge structure areas. The undocumented fill, loose, soft, firm or disturbed native soils should be excavated, processed, and stockpiled for later use as compacted structural fill. After stripping, the exposed hydro-collapsible native soils should be excavated to provide a zone of structural fill for the support of embankments, concrete channel linings, footings, asphaltic pavements and any concrete slabs-on-grade. A representative of this office should observe the bottom of the overexcavation prior to the continuance of grading to ascertain whether the recommended removals have been made and whether the exposed soils are suitable for the support of structural fill. To help reduce the hydro-collapse potential and erosion and subsequent maintenance of the detention basin bottom, the subgrade soils should be scarified to a depth of 12 inches and recompacted. If excavated on-site soils have a high expansion potential (greater than 8 percent), they should not be reused as structural fill in the lined outlet channel areas. The limits of the structural fill should be as shown on Figure No. 2 for the channels and as summarized in the following table:



Footnotes:

* Exposed natural soils should be scarified to a depth of 6 in., moistened and compacted according to the requirements for structural fill.

† See structural fill section for material and compaction requirements.

†† Concrete lined outlet channel

Converse Consultants Southwest, Inc.
Geotechnical Engineering and Applied Sciences

*Depth below embankments	3 to 6 feet[2]
*Depth below all footing bottoms	36 inches
*Depth below unlined channel bottoms	24 inches
*Depth below lined channel bottoms (filter gravel)	36 inches
*Depth below channel side slopes[3]	24 inches
*Depth below slabs-on-grade (supportive gravel)	18 inches
*Depth below asphaltic pavements	18 inches
*Depth below detention basin bottom (Optional)	12 inches
Minimum distance beyond upstream embankment toe	10 feet
Minimum distance beyond footings	5 feet
Minimum distance beyond pavements	2 feet

* Depth includes 6 inches (12 inches for detention basin bottom) of scarified and recompacted subgrade.
[2] See *Embankment* section.
[3] Measured perpendicular to design subgrade.
Note: The required depth of overexcavation can be reduced if moderately hard to hard cemented soils are encountered.

The subgrade in all areas to receive fill should be scarified to a minimum depth of 6 inches, the soil moisture adjusted to at least 2 percent above the optimum moisture content for silty and clayey soils and to within 2 percent of optimum for sandy soils, and then compacted to at least 90 percent for silty and clayey soils, and to at least 95 percent of the maximum laboratory dry density (as determined by ASTM D-1557) for sandy soils.

Structural Fill and Backfill: Structural fill and backfill is defined as fill supporting or placed behind structures. Fill consisting of excavated on-site soils or imported soils approved by the Geotechnical Engineer shall be placed in layers on approved subsoils. Soils used as compacted structural fill shall be free of organic matter and miscellaneous inorganic debris and inert rubble larger than 4 inches nominal size. Imported fill materials should be similar to on-site soils with the following characteristics:

a. be free of organics and inert materials larger than 4 inches,
b. have at least 35 percent passing the No. 200 sieve,
c. have a swell potential less than 5 percent,
d. have a gypsum solubility of 1 percent or less, and
e. have water soluble sodium sulfate percentage less than 0.2.

Based on our experience in the locale, water soluble soils (gypsiferous) may be encountered during grading. On-site gypsiferous soils, if encountered,

with a solubility of 2 percent or more by dry weight should not be used as embankment fill or structural fill. They can be used as embankment fill or structural fill after being thoroughly blended with imported or on-site non-gypsiferous soils at the minimum ratios given in the following table:

% Soluble Gypsum	*Estimated Blending Proportions Non-Gypsiferous Gypsiferous Soil
2 to 4	1:1
4 to 6	2:1
Above 6	cannot be used as structural fill

* Final blending proportions to be established by laboratory testing.

Soils which have more than six percent soluble gypsum, if encountered, cannot be used to produce acceptable structural fill, and must be removed and disposed of off-site or in an area on-site where structural fill will not be placed over this wasted soil.

Embankment fill soils and structural fill soils should be moisture adjusted to at least 2 percent above the optimum moisture content for silty and clayey soils and to within 2 percent of optimum for sandy soils, and then compacted to at least 90 percent of the maximum laboratory dry density (as determined by ASTM D-1557).

Material Volume Changes: There will be shrinkage losses or swell when excavating and compacting the on-site soils. An estimated shrinkage factor of 20 to 30 percent is applicable for the natural non-cemented soils. A subsidence factor of 0.1 feet should be used in all areas where the exposed native soils are compacted to a depth of six inches. An estimated swell factor of 0 to 10 percent is applicable for the natural cemented soils.

Excavations: Based on observations made during our field explorations, the majority of the native soils are noncemented and can be excavated with conventional earthwork equipment. In some areas the materials below the surficial soils contain zones which vary between partially cemented (moderately

hard) to cemented (hard). Heavy-duty ripping, heavy-duty backhoe, headache ball, or Ho-ram should be anticipated. The Contractor should be aware of the potential for vibrational damage to adjacent or nearby structures when using heavy impact equipment during removal of moderately hard to hard cemented materials.

Excavations over 4 feet deep should be laid back to safe slopes. Cut slopes should be in accordance with the *Occupational Safety and Health Standards for the Construction Industry* (29 CFR Part 1926) Section No. 1926.650 through .653 as currently amended. Safety of construction personnel is the responsibility of the Contractor.

STRUCTURE FOUNDATIONS

The proposed bridge and Con/Span structures may be supported by conventional spread footings founded on a properly placed and compacted zone of structural fill. Spread footings founded on structural fill are expected to experience total settlements on the order of ½ to ¾ inch. Differential settlements should be on the order of ½ the total settlements or less. Settlements should occur immediately after loading.

Due to the hydro-collapsible and expansive nature of the foundation soils, slight movement of foundations may occur. For this reason, we have recommended reinforcement of foundations and wingwalls in order to minimize cracking should movement occur. The reinforcement is not intended as a structural solution, but is in accordance with local practice and experience in the area. Specific design recommendations are provided as follows:

1. Spread footings, placed a minimum of 18 inches below adjacent finished grade, and a minimum of 12 inches wide, which bear on structural fill and are above the zone of saturation, may be designed for a maximum allowable bearing pressure of 1,500 pounds per square foot (psf). This allowable value may be increased by 250 psf for each additional foot of footing width and by 750 psf for each additional foot of footing embedment up to a maximum of 3,500 psf. A one-third increase in allowable bearing pressures may be used for short duration loads, such as wind or seismic.

2. Spread footings, placed a minimum of 36 inches below adjacent finished grade, and a minimum of 24 inches wide, which bear on structural fill and are below the zone of saturation, may be designed for a maximum allowable bearing pressure of 2,000 pounds per square foot (psf). This allowable value may be increased by 150 psf for each additional foot of footing width and by 500 psf for each additional foot of footing embedment up to a maximum of 3,500 psf. A one-third increase in allowable bearing pressures may be used for short duration loads, such as wind or seismic.

3. Lateral loads may be resisted by friction between the footing base and supporting soil, and lateral bearing pressure against the sides of footings. For design purposes, a coefficient of friction of 0.35 and a lateral bearing pressure of 190 psf (125 psf below water levels) per foot of depth up to a maximum of 1,500 psf are appropriate. If the design makes use of passive earth pressures, it is important that a representative of this office be present during the placement of any backfill against footings to observe and/or test the backfill.

4. Due to the clay swell potential of the on-site soils, any concrete slab-on-grade floors should be supported by a 4-inch layer of compacted gravel overlying an 18 inch zone of structural fill. The gravel may consist of Type I or Type II Aggregate Base.

5. Due to the clay swell and hydro-collapse potential of the on-site soils, it is our opinion that footings should be reinforced with a minimum of 2 No. 4 bars near the top of any stemwalls, and 2 No. 4 bars near the footing base. Any concrete slab-on-grade floors should be reinforced with 6" x 6", W4 x W4 woven wire fabric or No. 3 bars at 18 inches each way, center to center. Reinforcement should be installed at mid-height in the slab.

6. All concrete placement, curing operations, and control joint spacing should be in accordance with American Concrete Institute (ACI) recommendations.

BOX STRUCTURES

The proposed box structures should receive adequate support from properly placed and compacted structural fill. If undocumented fill soils and/or loose, soft, firm or disturbed soils are exposed at the base of the structure, these unsatisfactory materials should be removed or compacted in place.

The box structures may be designed using a maximum allowable net bearing capacity of 2,000 pounds per square foot (psf). The allowable bearing pressures may be increased by one-third for short term dynamic loads (such as seismic loads). Box structures should also be designed for 130 pounds per cubic foot vertical soil loads.

LATERAL EARTH PRESSURES

Subsurface walls, such as bridge abutments, wingwalls and outlet works (box structures) should be designed to resist lateral soil pressures. Figure No. 3 presents recommended lateral earth pressures for both restrained (rigid) and unrestrained (cantilevered) walls that are above water levels. These pressures assume that compaction within about five feet of the wall will be accomplished with relatively light-weight compaction equipment. The pressures provided assume that hydrostatic pressure build-up will not be permitted. Figure No. 4 presents recommended lateral earth pressures for both restrained (rigid) and unrestrained (cantilevered) walls that are below water levels. These pressures assume that compaction within about five feet of the wall will be accomplished with relatively light weight compaction equipment. The value of the surcharge pressure, "q", is equal to the pressure induced by adjacent uniform loads or traffic loads. As noted on Figure Nos. 3 and 4, the pressure distribution on restrained subsurface walls less than or equal to 12 feet is the same distribution shown on unrestrained subsurface walls. CCSW should review the design of all retaining walls in excess of 20 feet in height.

We recommend that the backfill behind subsurface walls consist of on-site or similar imported soils. Backfill materials should be non-expansive and cleaned of organics and inert materials larger than 4 inches nominal size. Backfill should be placed against undisturbed stiff to very stiff silts and clays, medium dense to dense granular soils, and/or properly placed and compacted structural fill. Prior

to placing backfill, the area behind the structures should be cleaned of construction debris and any soft, firm, loose or disturbed soils. The backfill should be placed in maximum 9-inch loose lifts and compacted to between 90 and 95 percent of the maximum laboratory density (ASTM D1557). Over compaction should be avoided.

EMBANKMENT SECTIONS

We understand that the south embankment will have an upstream height of 23 feet and a downstream height of 16 feet. The west spillway embankment will have an upstream height of 16 feet and a downstream height of 12 feet. To prevent settlement of the embankments due to hydro-collapse, a zone of properly placed and compacted structural fill should provide adequate support for the embankments after the surface vegetation and organics have been removed and the foundation preparation has been conducted as explained in the previous *Earthwork* section. The overexcavation depth should extend at least 6 feet below the embankment bottoms. Since the embankment heights gradually decrease to zero, the depth of overexcavation may start to gradually step down from 6 feet to 3 feet where the embankment height has decreased to 12 feet. We recommend a homogeneous embankment section consisting of on-site soils. The on-site soils are generally suitable for use as materials for dike embankment fill or other structural fills. On-site gypsiferous soils with a solubility greater than 2 percent, if encountered should not be used as embankment fill. Gypsiferous soils should be blended, as explained in the *Structural Fill and Backfill* subsection, with on-site or imported non-gypsiferous soils prior to use as embankment fill.

Slope Stability: Our stability analyses performed for the embankment sections were done to determine the steepest allowable upstream and downstream slopes with acceptable factors of safety. The analyses were performed on the upstream and downstream south embankment slopes, the spillway embankment upstream slope and the proposed spillway downstream slope which is 2:1 (horizontal to vertical) with a soil-cement surface. The analyses performed indicated that the south embankment slopes should not be made steeper than 2½:1 (horizontal to vertical). The steepest upstream slope for the

spillway embankment should be 2:1. The planned downstream spillway slope of 2:1 will be stable. The slope stability analyses assumed that all of the exposed embankment surfaces were adequately protected from erosional forces.

The slope stability analyses were performed on the embankments in general accordance with the Nevada State Statutes, U.S. Army Corps of Engineers guidelines, and the Clark County Regional Flood Control District *Hydrologic Criteria and Drainage Design Manual.* The dike was analyzed with the computer program SB-Slope, Version 3.0. It was used to calculate the minimum factor of safety for five separate cases: (1) end of construction, (2) end of construction with seismic loading, (3) steady-state seepage, (4) seismic steady-state seepage, and (5) sudden drawdown.

The SB-Slope program utilizes the simplified Bishop method of slope stability analysis for circular failure surfaces. It was assumed that the maximum failure surface extended about 20 feet into native soils. An analysis was also performed on the upstream slopes of both embankments for the sudden drawdown case using a pore pressure coefficient (Ru) of 0.7. Factor of safety values of 1.2 and 1.3 were calculated for the south and west embankments, respectively. A summary of the minimum acceptable factors of safety, and calculated factors of safety for the steepest allowable embankment slopes is presented in Table Nos. 3 and 4 on the following page. The results of the slope stability analysis are presented and further explained in Appendix B.

Embankment Settlement: The proposed embankments are estimated to experience total settlements of about 1 to 2 inches or less. This settlement will be due to the weight of the embankment as it is placed. Most of the settlement will occur as the embankment is constructed. The settlement computations were made in accordance with the procedures discussed in the U.S. Army Corps of Engineers Engineer Manual, EM 1110-1-1904 dated September 30, 1990.

SEEPAGE CONTROL

Based on the fine-grained and relatively impervious nature of the soils present at the site, and a maximum detention time of 36 hours, it appears that seepage through the proposed embankments should not be a problem. However, there is a potential for piping and seepage around and near the box outlet structure if compaction around the structure is not done properly. Compaction

[2] Seismic evaluation was based on pseudo-static analysis with seismic coefficient of 0.10.

around and adjacent to the structure should be observed and adequately test by a representative of this office to insure that there are no under compacted areas. Based on our review of preliminary plans, it is planned to place a blanket of Type II Aggregate Base under the outlet intake box structures. To prevent a potential seepage path through the embankment, we recommend that the blanket not be used under the two 10 X 5 foot reinforced concrete boxes (RCB's) that extend through the embankment. They should be founded on structural fill.

EROSION PROTECTION

Based on the results of our field and laboratory investigations, it is our opinion that the on-site soils will be subject to erosion due to peak water velocities on the order of 10 feet per second. Therefore, erosion protection will be required along the unlined inlet channel near the bridge and transitions. Erosion protection for the channel may consist of gabions. The rock used for gabions should be resistant to weathering and water action, free from spoil and organic materials. Gabions should be designed within the guidelines and standards of the manufacturer. Final water velocities should be verified by a hydraulic engineer. Flow velocities may change due to placement of gabions.

In order to reduce the amount of scour and erosion of structural fill soils during heavy flows, we recommend that a puncture-resistant synthetic filter cloth (Trevira 1135 or approved equivalent) be placed between the structural fill soils and the gabions.

Other generally acceptable methods of erosion protection would include: (1) rip-rap, (2) soil-cement, which is generally placed in 7 to 8-foot wide horizontal lifts, (3) roller-compacted concrete, (4) concrete pavement, and (5) precast concrete blocks.

We are available to provide additional detailed recommendations for erosion protection if other alternates are utilized and information is required.

Some erosion protection for unprotected slopes can be achieved by making the slopes flatter than required for acceptable factors of safety. The areas where grass is planned within the golf course should be protected from surface runoff provided the slopes are fairly flat.

Spillway Embankment: We understand that a part of the spillway embankment crest and downstream slope will be lined with soil-cement. The planned downstream slope is 2:1 (horizontal to vertical). If soil-cement is used on the outer face, it should be a minimum of 12 inches thick (perpendicular to the slope) from a construction standpoint. Soil-cement slope protection is normally placed by one of two methods. Lifts of the soil-cement can be placed parallel to the slope and compacted. This method usually requires a minimum soil-cement lift width equal to the width of the equipment (about 8 feet). The outer face of the slope is normally overbuilt with this method, and trimmed back to the final face. With this method, the planned 2:1 (horizontal to vertical) slope could be constructed.

Soil-cement can also be placed and compacted in lifts perpendicular to the slope. With this method, the soil-cement thickness can be reduced but it is normally necessary to flatten slopes, so that placement and compaction equipment can operate up and down the slope. Our past experience has indicated that with conventional placement and compaction equipment, this usually requires slopes of 4:1 (horizontal to vertical) or flatter.

The final thickness of the soil-cement erosion protection layer, should be determined by a qualified hydraulic engineer, after water velocities, and the soil-cement strength and durability characteristics have been determined. As previously stated, two soil-cement mix designs for the project are currently in progress and will be presented at a future date.

CHANNELS

The proposed inlet channel will generally be unlined. It will be lined with grass or gabions in some areas. The outlet channel will be concrete lined. Due to the porous and expansive nature of the clayey soils, overexcavation and recompaction will be required for the support of channel linings and to help prevent excessive erosion in unlined areas. The depth of overexcavation required should be 2 feet below finished grade in unlined channels and 3 feet below granular filter material in concrete lined areas. Concrete lined and unlined channels should generally conform with the Clark County Regional Flood Control District (CCRFCD) *Hydrologic Criteria and Drainage Design Manual* (Criteria Manual).

Unlined Channel: Unreinforced side slopes should be constructed no steeper than 3:1 (horizontal to vertical). For steeper channel side slopes, recommendations will be required for slope reinforcement. In cut slope areas after overexcavation, it may be necessary to recompact structural fill beyond the limits of the slope and then recut the slopes to the desired grade. We recommend that converging runoff should be controlled and properly diverted into the unlined channel so that erosion of the slope is minimized.

Concrete Lined Outlet Channel: Permanent unreinforced cut and fill side slopes should be constructed at a maximum slope of 2:1 (horizontal to vertical). In cut slope areas after overexcavation, it may be necessary to recompact structural fill beyond the limits of the slope and then recut the slopes to the desired grade. Satisfactory support for concrete lining panels may be provided by a 6-inch blanket of granular filter material overlying a properly placed and compacted zone of structural fill. The granular filter material should have a maximum size of 2 inches, contain less than 10 percent (preferably less than 5 percent) passing a No. 200 sieve, and be well graded. The filter material should be moisture conditioned to obtain a soil moisture within 2 percent of optimum and compacted to at least 95 percent of the maximum dry density (ASTM D1557). It may be necessary to compact the granular filter material on the side slopes about 1 foot thick and then cut it back to the required 6-inch thickness. Prior to placement of the granular blanket, the subgrade soils should have been processed as recommended in the *Earthwork* section of this report.

Continuity of the concrete surface is essential throughout the reach of the lined area. Accidental offsetting of panels at construction joints could disturb channel flow and may induce cavitation. We suggest that the slabs be dowelled at expansion joints to inhibit offsets. In order to drain accumulated water beneath concrete panels and to prevent the build up of hydrostatic pressures, weep holes, 3 inch in diameter, should be installed in channel bottoms and side panels.

Weep holes should be spaced so there is one set of weep holes located 1 foot upstream of any cutoff walls, and at least one more set located approximately halfway between cutoff walls. The weep holes should be protected against clogging by installing a geotextile filter fabric (at least 1 square foot and consisting of Trevira 1114 or an approved equivalent) behind the weep hole, and by filling the weep hole with the granular filter material as previously described.

To further minimize the accumulation of water behind the panels, we suggest that the concrete panels have a turned down edge (longitudinal cutoff) which extends down to at least 3 feet below the top of slope. We also recommend that converging runoff from the east along Toiyabe Street should be controlled and properly diverted into the channel so that erosion behind the slope does not occur.

We recommend that the concrete panels be designed to minimize shrinkage and development of thermal and flexural stresses. Slab reinforcement should consist of bars rather than mesh and should be installed at mid-height of the slab. Special precautions should be taken during the placement and curing of all concrete panels. Excessive slump (high water-cement ratio) of the concrete and/or improper curing procedures used during either hot or cold weather conditions could lead to excessive shrinkage, cracking, or curling in the panels.

CORROSION AND SULFATE PROTECTION

Laboratory test results indicate that the on-site soils are corrosive to buried metal and have sulfate levels above that are considered harmful to normal strength concrete.

1. Consideration should be given to corrosion protection systems for buried metal such as cathodic protection, protective coatings or wrappings, or the use of PVC where permitted by local building codes.

2. All concrete in contact with the on-site soils should have one of the following concrete mixtures.

Type of Cement	Minimum Sacks of Cement per Cubic Yard	Maximum Water Cement (plus Fly Ash) Ratio
Type V	6.0	0.50
Type II and Fly Ash*	6.0 **	0.50
Type V and Fly Ash*	5.5 **	0.53

* Type F fly ash as defined in ASTM C618.

** Cement to be removed and replaced with fly ash shall be 13% to 20% of the weight of cement. Fly ash added at the mixer shall be in a proportion of 1.2 minimum to the weight of cement removed.

3. The concrete should be placed with a maximum 4-inch slump and good densification procedures should be used during placement to prevent honeycombing.

SOIL-CEMENT

A series of twelve (12) test pits were excavated to obtain representative soil samples from the two potential sources to be used for the soil-cement mix designs. The mix designs were to be performed on a fine-grained sample and a granular sample. A 1,000 psi 28-day strength was requested for both mix designs. As previously mentioned the results of the mix designs will be presented in a report at a later date. The test pits were also excavated to try and define where the soils changed from fine-grained on the west to predominantly granular soils towards the east. A general summary of the test pits is presented in Appendix A (page A-8). The estimated boundary between the two soil types is indicated on Drawing No. 2. Based on preliminary results of the mix designs, it appears that the fine-grained soils will require at least 15 to 18 percent cement and the granular soils 9 to 12 percent. It appears that the granular soils would be the desired choice for soil-cement. However, the source of granular material is small as shown on Drawing No. 2. It may be necessary to excavate and stockpile the granular soils from the east for use as aggregate in the soil-cement. The borrow area would then be backfilled with fine-grained structural fill.

ASPHALTIC CONCRETE PAVEMENT

Asphaltic concrete pavement sections were developed for the main road near the project, and the golf cart and maintenance vehicle paths. In developing our recommendations, we have assumed that (1) 18 inches of structural fill will be placed beneath the pavement section, (2) Traffic Index (T.I.) values of 2.0 for golf cart paths, 3.0 for maintenance roads, and 5.5 for the main road, are appropriate, and (3) an R-value of 20 (based on soil classification) is representative of recompacted native soils. If the T.I. values are not considered appropriate, the pavement sections should be re-evaluated. Our design procedures were in accordance with Caltrans method of designing flexible pavement.

1. The following table presents the minimum recommended structural pavement sections:

Traffic Condition	Assumed Traffic Index (T.I.)	Asphalt Thickness (Inches)	Type II Base Thickness (Inches)	*Compacted Subgrade Thickness (Inches)
Golf Carts	2.0	2	0	18
Maintenance Road	3.0	2	4	18
Main Road	5.5	2½	10	18

* Compacted subgrade thickness may be reduced if cemented soils are encountered.

2. Asphaltic concrete should be mixed and placed in accordance with Section 401 of the *Uniform Standard Specifications for Public Works' Construction, Off-Site Improvements, Clark County, Area, Nevada*, 1986 Edition (USSPWC).

3. Type II Aggregate Base should conform with Section 704.03.04, USSPWC. Base materials should be placed and compacted in accordance with Section 302 of USSPWC.

4. Asphaltic concrete and base materials should be tested prior to delivery to the site and during placement to determine conformance with the project specifications.

PROJECT REVIEW AND CONSTRUCTION OBSERVATION

This report has been prepared to aid in the evaluation of this site and to assist in the design of this project. This office should be provided the opportunity to review the final design drawings and specifications in order to determine whether the assumptions and recommendations presented in this report are valid and have been implemented. Review of the final design drawings and specifications should be noted in writing and become a supplement to this report.

Variations in soil conditions may be encountered during construction of this project. In order to permit correlation between the field conditions encountered in this investigation and the actual conditions encountered during construction, and to confirm recommendations presented herein, this office should be retained to perform sufficient review during construction of this project. Observation and testing should be performed during construction to confirm that the recommended foundation preparations are performed, that suitable fill and backfill soils are placed properly on prepared native soils, and that fills are properly placed and compacted.

CLOSURE

The recommendations given in this report are based on results of field and laboratory investigations, combined with interpolation of subsurface conditions between boring and trench locations. The nature and extent of variations between the explorations may not become evident until construction. If variations are exposed during construction, this office should be notified so the variations can be reviewed and the recommendations of this report modified or verified in writing.

If changes in the nature, design, or location of the facility are planned, the recommendations contained in this report shall not be considered valid unless the changes are reviewed and the recommendations of this report modified or verified in writing.

This report has been prepared only to aid in the evaluation of this site and to provide geotechnical recommendations for the design of this project. Any person using this report for bidding or construction purposes should be aware of the limitations of this report as mentioned above and should conduct an independent investigation as he deems necessary to satisfy himself as to the surface and subsurface conditions to be encountered, and the procedures to be used in the performance of work on this project.

It has been our pleasure to serve you on this project. If you have any questions, please contact this office.

Respectfully submitted,

APPENDIX A

FIELD AND LABORATORY INVESTIGATIONS

Field Investigation

The subsurface soil conditions were explored by drilling thirty-six (36) exploratory borings to depths ranging from 15 to 40 feet. In addition, a series of exploratory test pits were excavated to depths ranging from 5 to 6 feet to try and delineate where the fine-grained soils changed granular soils towards the east side of the project. The approximate locations of the explorations are shown on Drawing No. 2. Continuous logs and general logs of the subsurface conditions as encountered in the borings and test pits, respectively, were recorded at the time of drilling by a field engineer. The subsurface conditions encountered in the borings were visually classified in accordance with ASTM D2487-90, which is based on the Unified Soil Classification System. Summaries of the subsurface conditions encountered in the borings are presented on the boring summary sheets, Drawing Nos. A-1 through A-40. A key to soil symbols and terms is found on Drawing No. A-41. The soil classification system for engineering purposes is further explained on Drawing No. A-42. Summaries of the subsurface conditions encountered in the exploratory test pits are presented in this Appendix.

Drilling was accomplished with truck-mounted air rotary (Mayhew 1000) and hollow-stem (BK-81) drill rigs equipped for soil sampling. Relatively undisturbed soil samples were obtained using a 2.5-inch inside diameter Converse sampler. The sampler was driven with either a 340-pound (air rotary) or 140-pound (hollow-stem) hammer free-falling through a distance of 30 inches. Sampler driving resistance, expressed as blows per foot of penetration, is presented on the boring logs at the respective sampling depths. The test pits were excavated with a Case 580E rubber-tired backhoe.

Laboratory Investigation

Laboratory tests were conducted on representative soil samples for the purpose of classification, and determination of their physical properties and engineering characteristics. The amount and selection of the types of testing for a given study are based on the geotechnical conditions of the project. A summary of the various laboratory tests conducted by our office for engineering purposes is presented below.

MOISTURE CONTENT AND DRY DENSITY: Data obtained from these tests, performed on relatively undisturbed samples obtained from the field, were used in the classification and correlation of the soils and to provide qualitative information regarding soils strength and compressibility. Test results are presented on the summary boring logs, Drawing Nos. A-1 through A-40.

SWELL: Representative undisturbed and remolded samples of the soils were tested in the laboratory to determine their moisture content volume-change characteristics. The remolded samples were compacted to an estimated 85 to 90 percent of the maximum density above the optimum moisture content. Each sample was confined under a normal pressure of 60 pounds per square foot and the percent of vertical movement after introduction of water into the samples was determined. The test results are presented below:

Exploration Location	Depth (feet)	Soil Description	Moisture Content (percent) Initial	Air-Dry	Final	Percent Swell
B-119	14-15	LEAN CLAY	21	15	35	8.4
*B-121	9-10	FAT CLAY	10	6	28	3.6
B-136	4-4½	LEAN CLAY	17	10	41	10.2

** From preliminary investigation.

DIRECT SHEAR STRENGTH: Progressive direct shear tests were performed on selected relatively undisturbed and remolded samples using a constant strain rate direct shear machine. The remolded samples were compacted to 90 percent of the maximum dry density at above optimum moisture content for fine-grained soils and within 2 percent of optimum for granular soils. The samples were placed in the shear machine, a specified normal load was applied, most of the samples were saturated and then sheared until a maximum shear strength was developed. After the soil specimen had developed maximum shear resistance under the first normal load, the normal load was removed and the specimen was pushed back to its original undeformed configuration. Another normal load was then applied, and the specimen was sheared a second time. This process was repeated for several different normal loads. Results of the direct shear tests are presented in the following table:

Exploration Location	Depth (feet)	Soil Description	Angle of Internal Friction (°)	Coulomb Cohesion (psf)
B-101	7-8	LEAN CLAY	33	50
B-101	14-14½	LEAN CLAY	29	300
B-103	9-10	FAT CLAY	29	800
B-104	14-15	LEAN CLAY	35	250
B-106	9-10	SANDY LEAN CLAY	33	400
B-107 Dry	4-5	LEAN CLAY	39	800
B-108	9-10	GYPS. LEAN CLAY	34	350
*B-125	4-5	SILTY CLAY	34	400
*B-126	0-1½	SANDY LEAN CLAY	18	300

B-2[2]	14	CLAYEY SAND	39	250
*T-1[2]	3-5	SILTY CLAY W/Sand	18	400

Dry = Sample was not saturated
* Test performed on remolded sample
[2] From preliminary investigation

SOLUBILITY: Solubility tests were performed to determine the amount of water-soluble materials (principally gypsum) present in the soil. After drying the samples in a 60-degree centigrade oven, about 2.0 liters of tap water was passed through each sample. The samples were then oven-dried and the amount of soluble materials lost was calculated. The results of the solubility tests are presented in the following table:

Exploration Location	Sample Depth (feet)	Soil Description	Solubility (percent by dry weight)
B-110	6-7	LEAN CLAY few gyp	0.6
B-121	0-1	SANDY SILT few gyp	4.6
B-123	1-2	LEAN CLAY	0.2
B-123	4-5	LEAN CLAY	0.4
B-124	4-5	LEAN CLAY	1.0
B-126	1-2	SANDY LEAN CLAY few gyp	0.2
B-129	1-2	SILTY SAND few gyp	2.3
B-130	4-5	SANDY LEAN CLAY few gyp	1.9
B-132	4-5	LEAN CLAY few gyp	1.4

B-136	1-1½	LEAN CLAY few gyp	1.7
B-1*	9	FAT CLAY	3.7
B-1*	19½	LEAN CLAY	0.1
B-2*	9-10	LEAN CLAY	1.9
B-2*	24½	LEAN CLAY	2.1
T-1*	3½	SILTY CLAY W/ Sand	1.2
T-2*	3½	LEAN CLAY W/ Sand	0.1

* From preliminary investigation

GRAIN SIZE DISTRIBUTION: Grain size distribution for soil samples were determined by sieve analysis in accordance with ASTM C-136. Basically, a sieve analysis is conducted by passing the soil through a number of different sized sieves and measuring the amount of soils retained on each sieve. The test results from the previous investigation are presented in Appendix C, Drawing Nos. A-13 through A-18. The test results from this investigation are presented in the following table:

	Percent Passing Sieve			
Sieve Sizes	*T-101	T-102	T-106	T-108
Depth	3-5'	1-5'	5-6'	2-6'
3"			100	100
2"			96	92
1½"			88	86
1"			80	77
3/4"			73	69
1/2"			61	58
3/8"	100		54	51

No. 8	96		39	35
No. 16	94	100	36	31
No. 30	91	99	34	29
No. 50	87	97	30	26
No. 100	76	94	22	17
No. 200	53	88	14	9

* Bulk sample location from which soil sample was obtained.

ATTERBERG LIMITS: The liquid limit, plastic limit and plasticity index of a representative samples of the fine-grained soils were determined to aid in the classification of the soils and in the evaluation of other engineering parameters. The test was performed in general accordance with ASTM test designation D4318 method. The result of the test is tabulated in the following table:

Exploration Location	Sample Depth (ft)	Liquid Limit (%)	Plastic Limit (%)	Plasticity Index	Unified Soils Classification
B-105	4-5	29	19	10	CL
B-107	4-5	32	21	11	CL
B-129	4-5	NP	NP	NP	SM
B-1•	5.5	35	20	15	CL
B-2•	6.5	30	15	15	CL
T-1•	3-5	25	18	7	CL-ML
T-2•	3-5	36	21	15	CL
T-4•	3-5	21	17	4	CL-ML
T-5•	3-5	35	18	17	CL

NP = Non-plastic
• From preliminary investigation.

LABORATORY MAXIMUM DENSITY: Laboratory maximum density tests were performed on selected samples. The purpose of the tests was to define the compaction characteristics of these soils, and to aid in estimating soil shrinkage. The laboratory maximum density tests were performed in general accordance with the ASTM D-1557 test method. This test procedure uses 25 blows of a 10-pound hammer falling a height of 18 inches on each of five layers of soil on a 1/30 cubic foot cylinder. The test results are presented in the table below:

Exploration Location	Depth (feet)	Soil Description	Maximum Dry Unit Weight (pcf)	Optimum Moisture Content (percent of dry weight)
B-121	0-1	SANDY SILT	118	11.5
B-126	0-1½	SANDY LEAN CLAY	119	11.5
B-130	0-1½	SILTY CLAY	121	11.4
T-1•	3-5	SILTY CLAY w/Sand	117	11.2
T-4•	3-5	SILTY SAND	118	11.0
T-5•	3-5	SANDY LEAN CLAY	120	11.4

• From preliminary investigation

PERMEABILITY: Falling head tests were conducted on remolded samples. The soil was compacted to about 90 percent of the maximum dry density above optimum moisture content in a mold 4.6 inches long and 4.0 inches in diameter. A falling head was applied to the sample and flow of water through the sample was monitored after a saturation period. The permeability was calculated after the flow rate had stabilized. The results of the falling head permeability test are presented in the following table:

Exploration Location	Depth (feet)	Soil Description	Coefficient of Permeability (cm/sec)
T-102	1-5	LEAN CLAY	2.3×10^{-6}
Blended*	1-5	LEAN CLAY	1.5×10^{-6}
T-1**	3-5	SILTY CLAY w/Sand	3.5×10^{-5}
T-4**	3-5	SILTY SAND	1.5×10^{-5}
T-5**	3-5	SANDY LEAN CLAY	2.7×10^{-5}

* Blended samples from T-101, T-102 & T-103.
** From preliminary investigation

CHEMICAL ANALYSIS: Chemical tests were performed on representative soil samples to investigate the potential for soil corrosivity and chemical heave. The chemical analysis for water soluble sulfates and sodium was performed by Atlas Chemical Testing Laboratories, Inc. in Las Vegas, Nevada. The results of the chemical tests are presented in the following table:

Exploration Location	Depth (feet)	Soil Description	Percent Sodium	Percent Sulfate	Total Available Water Soluble Sodium Sulfate (%)
B-123	1-2	LEAN CLAY	<0.01	0.13	<0.01
B-126	0-1½	SANDY LEAN CLAY	0.03	0.22	0.09
B-129	1-2	SILTY SAND	<0.01	0.03	<0.01
B-130	4-5	SANDY LEAN CLAY	0.06	1.14	0.20
B-136	1-1½	LEAN CLAY	0.15	1.30	0.45

KEY TO SOILS SYMBOLS AND TERMS

Terms used in this report for describing soils according to their texture or grain size distributions are generally in accordance with the UNIFIED SOILS CLASSIFICATION SYSTEM.

TERMS DESCRIBING CONDITION, CONSISTENCY AND HARDNESS

COARSE GRAINED SOILS (major retained on No. 200 sieve): includes (1) clean gravels, (2) silty or clayey gravels and (3) silty, clayey or gravelly sands. Consistency is rated according to relative density, as determined by laboratory tests.

Descriptive Term	Relative Density
very loose	0 to 15%
loose	15 to 40%
medium dense	40 to 70%
dense	70 to 85%
very dense	85 to 100%

FINE GRAINED SOILS (major portion passing No. 200 sieve): includes (1) inorganic and organic silts and clays, (2) gravelly, silty or sandy clays, and (3) clayey silts. Consistency is rated according to shearing strength as indicated by penetrometer readings or by direct shear tests.

Descriptive Term	Relative Density
very soft	less than 0.25
soft	0.25 to 0.50
firm	0.50 to 1.00
stiff	1.00 to 2.00
very stiff	2.00 to 4.00
hard	4.00 and up

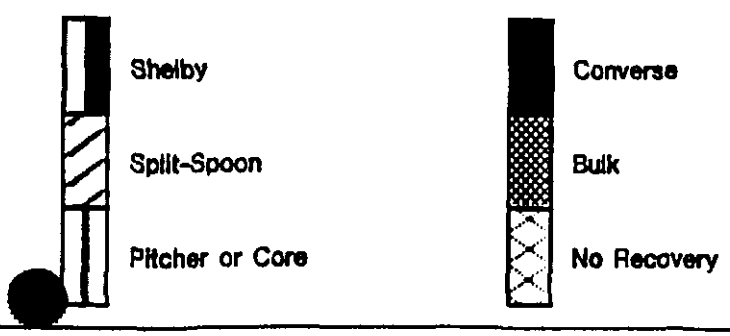
ROCK: includes gravels, cobbles, rock, caliche and bedrock materials. Hardness is related to field identification procedures described below.

Descriptive Term	Relative Density
soft	Can be dug by hand and crushed by fingers.
moderately hard	Friable, can be gouged deeply with knife and will crumble readily under light hammer blows.
hard	Knife scratch leaves dust trace, will withstand a few hammer blows before breaking.
very hard	Scratched with knife with difficulty, difficult to break with hammer blows.

LEGEND OF FIELD AND LABORATORY TESTS

A	Liquid & Plastic limits	G	Grain	P	Compaction
C	Consolidation	N	Chemical Heave	S	Swell
Ch	Chemical	pp	Unconfined compressive strength in tsf from pocket penetrometer	Sol	Solubility
DR	Drill Rate sec./ft.			T	Triaxial
DS	Direct Shear			U	Unconfined

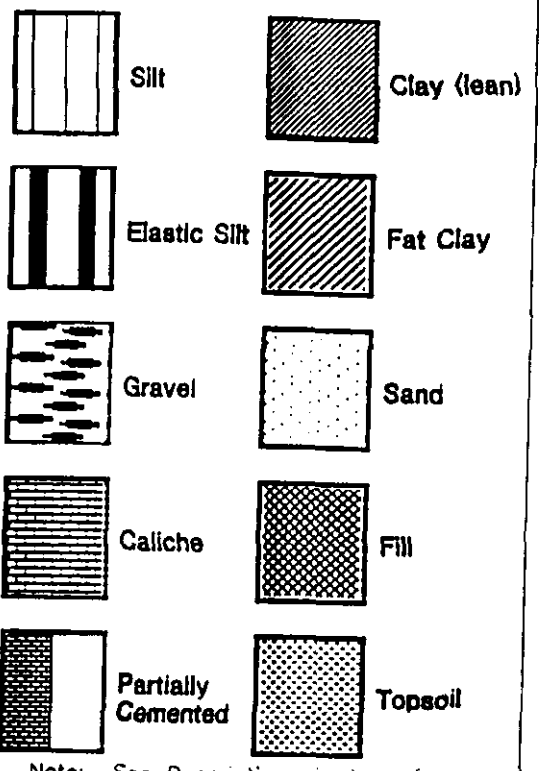
SAMPLER TYPES



SIZE PROPORTIONS

Designation	Percent by Weight
trace	0 to 5
few	5 to 10
little	15 to 25
some	30 to 45

SOIL TYPE GRAPHIC KEY



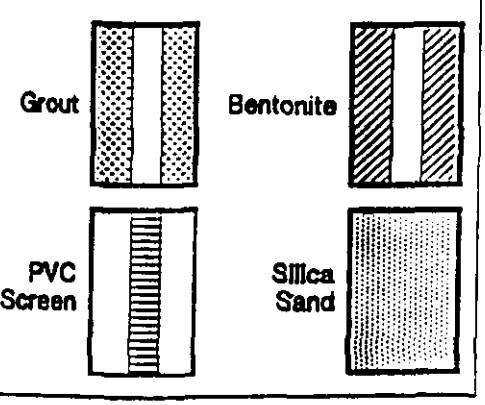
Note: See Descriptions in logs for others not shown here.

SOIL MOISTURE

From low to high the soil moisture is indicated by:

dry
slightly moist
moist
very moist
wet

WELL DESIGN GRAPHIC KEY



CLASSIFICATION OF SOILS FOR ENGINEERING PURPOSES

ASTM Designation: D 2487 - 90
(Based on Unified Soil Classification System)

			Soil Classification: Criteria for Assigned Group Symbols and Groups Names Using Laboratory Tests[A]	Group Symbol	Name[B]
Coarse-Grained Soils More than 50% retained on No. 200 sieve	Gravels More than 50% coarse fraction retained on No. 4 sieve	Clean Gravel Less than 5% fines[C]	$Cc \geq 4$ and $1 \leq Cc \leq 3^E$	GW	Well graded gravel[F]
			$Cu < 4$ and/or $1 > Cc > 3^E$	GP	Poorly graded gravel[F]
		Gravels with Fines More than 12% fines[C]	Fines classify as ML or MH	GM	Silty gravel[F G H]
			Fines classify as CL or CH	GC	Clayey gravel[F G H]
	Sands 50% or more of coarse fraction passes No. 4 sieve	Clean Sands Less than 5% fines[D]	$Cu \geq 6$ and $1 \leq Cc \leq 3^E$	SW	Well-graded sand[I]
			$Cu < 6$ and/or $1 > Cc > 3^E$	SP	Poorly graded sand[I]
		Sands with Fines More than 12% fines[D]	Fines classify as ML or MH	SM	Silty sand[G H I]
			Fines classify as CL or CH	SC	Clayey sand[G H I]
Fine-Grained Soils 50% or more passes the No. 200 sieve	Silts and Clays Liquid limits less than 50	Inorganic	$PI > 7$ and plots on or above "A" line[J]	CL	Lean clay[K L M]
			$PI < 4$ or plots below "A" line[J]	ML	Silt[K L M]
		organic	$\frac{\text{Liquid limit - oven dried}}{\text{Liquid limit - not dried}} < .75$	OL	Organic clay[K L M N] Organic silt[K L M O]
	Silts and Clays Liquid limit 50 or more	Inorganic	PI plots on or above "A" line	OH	Fat clay[K L M]
			PI plots below "A" line	MH	Elastic silt[K L M]
		organic	$\frac{\text{Liquid limit - oven dried}}{\text{Liquid limit - not dried}} < .75$	OH	Organic clay[K L M P] Organic silt[K L M O]
Highly organic soils	Primarily organic matter, dark in color, and organic odor			PT	Peat

[A] Based on the material passing the 3-in. (75-mm) sieve.

[B] If field sample contained cobbles or boulders, or both, add "with cobbles or boulders, or both" to group name.

[C] Gravels with 5 to 12% fines require dual symbols:
GW-GM well-graded gravel with silt
GW-GC well-graded gravel with clay
GP-GM poorly graded gravel with silt
GP-GC poorly graded gravel with clay

[D] Sands with 5 to 12% fines require dual symbols:
SW-SM well-graded sand with silt
SW-SC well-graded sand with clay
SP-SM poorly graded sand with silt
SP-SC poorly graded sand with clay

[E] $Cu = D_{60}/D_{10}$ $Cc = \frac{(D_{30})^2}{D_{10} \times D_{60}}$

[F] If soil contains $\geq 15\%$ sand, add "with sand" to group name.

[G] If fines classify as CL-ML, use dual symbol GC-GM, or SC-SM.

[H] If fines are organic, add "with organic fines" to group name.

[I] If soil contains $\geq 15\%$ gravel, add "with gravel" to group name.

[J] If Atterberg limits plot in hatched area, soils is a CL-ML, silty clay.

[K] If soil contains 15 to 29% plus No.200, add "with sand" or "with gravel", whichever is predominant.

[L] If soil contains $\geq 30\%$ plus No. 200, predominantly sand, add "sandy" to group name.

[M] If soil contains $\geq 30\%$ plus No. 200, predominantly gravel, add "gravelly" to group name.

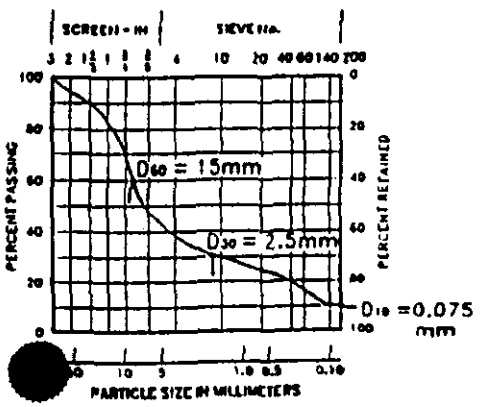
[N] $PI \geq 4$ and plots on or above "A" line.

[O] $PI < 4$ or plots below "A" line.

[P] PI plots on or above "A" line.

[Q] PI plots below "A" line.

SIEVE ANALYSIS



$C_u = \frac{D_{60}}{D_{10}} \frac{15}{0.075} = 200$ $C_c = \frac{(D_{30})}{D_{10} \times D_{60}} = \frac{(2.5)}{0.075 \times 15} = 5.6$

APPENDIX B

SLOPE STABILITY ANALYSIS

Based on the results of the field and laboratory investigations, slope stability analyses of the proposed embankment were performed. The analyses were performed to determine the steepest allowable slopes with acceptable factors of safety. The analyses were performed on the upstream and downstream south embankment slopes, the upstream spillway embankment slopes and the proposed downstream spillway slope which is 2:1 (horizontal to vertical) with a soil-cement surface. The stability analyses were conducted in general accordance with the Nevada State Statutes, the Clark County Regional Flood Control District *Hydrologic Criteria and Drainage Design Manual* and U.S. Army Corps of Engineers design criteria. The anticipated maximum south and west (spillway) embankment height sections were analyzed for five separate cases; (1) end of construction, (2) seismic end of construction, (3) steady-state seepage (4) seismic steady-state seepage, and (5) sudden drawdown.

The planned elevation of the south and west embankments embankment crests were 1823 and 1816, respectively. The crest widths of the south and west (spillway) embankments are 20 and 26 feet, respectively. The south embankment was analyzed with an upstream height of 23 feet and downstream height of 16 feet. The west (spillway) embankment was analyzed with an upstream height of 16 feet and downstream height of 12 feet. Under water storage conditions, the phreatic surface through the south embankment was assumed to intercept the downstream slope at on-fourth the height. Under water storage conditions, it was assumed that the spillway embankment was saturated and the phreatic surface was just under the soil cement and exited at the toe. The computer program SB-Slope, Version 3.0, developed by Von Gunten Engineering Software, Inc. was used to calculate the minimum factor of safety for each of the five cases for the embankments. The program utilizes the simplified Bishop Method of slope stability analysis for circular failure surfaces. The computer printouts showing the results of the stability analyses for the maximum allowable upstream and downstream slopes are also presented in this Appendix. The maximum slopes for the south embankment were 2½:1

(horizontal to vertical). The maximum upstream slope for the spillway embankment was 2:1. The planned downstream spillway slope of 2:1 appears to be stable. The location of two circular arcs, with the calculated minimum factors of safety for each case are shown on the computer printouts. Each arc represents the minimum factor of safety for the upstream and downstream slopes for each case. A pore pressure coefficient (Ru) of 0.7 was used for the sudden drawdown case for the south embankment. Printouts for the sudden drawdown case with a Ru of 0.7 are not included in this appendix. The maximum failure surface depth was assumed to be 20 feet below the embankments. The soil parameters used for the stability analyses and the calculated minimum factors of safety are presented in the following tables:

Soil Parameters Used For Factor of Safety Calculations

Soil	Moist Unit Weight (pcf)	Saturated Unit Weight (pcf)	Angle of Internal Friction		Cohesion (psf)	
			Moist	Sat	Moist	Sat
Structural Fill	120	130	30°	28°	350	300
Native Soils	95	105	28°	25°	300	250
Soil Cement	140	140	36°	36°	400	400

Note: The soil parameters used for the structural fill and native soils are based on laboratory test results.

Calculated and Required Factors of Safety for South Embankment
Upstream Height 23'; Downstream Height 16'

Loading Condition	Case	Required[1] F.S.	Calculated F.S. 2½:1 Slope Upstream	Calculated F.S. 2½:1 Slope Downstream
End of Construction	1	1.3	2.9	3.3
End of Construction With Seismic Loading[2]	2	1.0	2.3	2.5
Static-Steady State Seepage	3	1.5	2.7	2.2
Seismic-Steady[2] State Seepage	4	1.0	1.8	1.7
Sudden Drawdown	5	1.2	1.7 (1.2)[3]	2.2

[1] In accordance with the "Recommended Guidelines for Safety Inspection of Dams" published by the Corps of Engineers.
[2] Seismic evaluation was based on pseudo-static analysis with seismic coefficient of 0.1.
[3] Factor of safety with a pore pressure coefficient (Ru) of 0.7.

Calculated and Required Factors of Safety for West Embankment
Upstream Height 16'; Downstream Height 12'

Loading Condition	Case	Required[1] F.S.	Calculated F.S. 2½:1 Slope Upstream	Calculated F.S. 2½:1 Slope Downstream
End of Construction	1	1.3	3.2	3.4
End of Construction With Seismic Loading[2]	2	1.0	2.5	2.7
Static-Steady State Seepage	3	1.5	3.5	2.5
Seismic-Steady[2] State Seepage	4	1.0	2.3	1.9
Sudden Drawdown	5	1.2	1.8 (1.3)[3]	2.5

[1] In accordance with the "Recommended Guidelines for Safety Inspection of Dams" published by the Corps of Engineers.
[2] Seismic evaluation was based on pseudo-static analysis with seismic coefficient of 0.10.
[3] Factor of safety using a pore pressure coefficient (Ru) of 0.7.

DRAFT
PREDESIGN MEMORANDUM
SLOAN CHANNEL - OWENS AVENUE TO THE LAS VEGAS WASH

May 1993

Prepared for:

Clark County Public Works
6655 West Sahara Avenue
Las Vegas, Nevada 89102

Prepared by:

G. C. Wallace, Inc.
1555 South Rainbow Boulevard
Las Vegas, Nevada 89102

I. INTRODUCTION

The Sloan Channel improvements from Owens Avenue to the Las Vegas Wash confluence is part of the current Clark County Regional Flood Control District (CCRFCD) Master Plan Update of the Las Vegas Valley. This facility is intended to convey storm flows from the Range Wash drainage basin to the Las Vegas Wash. Other CCRFCD Master Plan facilities will eventually limit the 100-year return period flow in the Sloan Channel to 3,300 cfs. The location of the project is shown on Figure 1.

The Sloan Channel from Owens Avenue south to the Las Vegas Wash is currently an excavated, earthlined channel with an approximate bottom width of 60 feet and side slopes of roughly 2:1 (H:V). The Sloan Channel is crossed by five existing roadways in the project area. Bridges are present over the Sloan Channel at Washington Avenue and Charleston Boulevard. Reinforced Concrete Box (RCB) culvert crossings are present at Owens Avenue, Bonanza Road, and Stewart Avenue (see Figure 2). The length of this project is approximately 17,590 feet (3.3 miles).

Improvement drawings for this reach of Sloan Channel were previously prepared by Boyle Engineering Corporation (Boyle) in 1986. However, the project was not constructed. Boyle's design for the Sloan Channel proposed a trapezoidal, concrete-lined channel with side slopes varying from 1.5:1 (H:V) to 2:1 (H:V), and a bottom width varying from 60 feet to 70 feet.

II. SCOPE

The purpose and scope of this Predesign Memorandum is to :

- Present the results of an update to a previous geotechnical investigation and field reconnaissance to document surficial soils and subsurface conditions along the channel alignment.

1555 SOUTH RAINBOW BLVD./LAS VEGAS, NEVADA 89102

- Present the results of a hydraulic analysis of the Boyle design using design flows of 3,300 cfs with freeboard as required in the CCRFCD Hydrologic Criteria and Drainage Design Manual (Manual), and 6,000 cfs without freeboard.

  The design flow of 3,300 cfs is the ultimate flow that will be conveyed in the Sloan Channel when the Confluence Detention Basin has been constructed. The Confluence Detention Basin is a CCRFCD Master Plan facility that is to be located just south of Nellis Air Force Base. This detention facility will detain flows from the eastern and western tributaries of the Range Wash watershed. This facility is presently under design.

  The design flow of 6,000 cfs is an interim flow for the Sloan Channel prior to the construction of the Confluence Detention Basin. This design flow is based on existing diversion facilities within the upper portions of the western tributary of the Range Wash being place.

- Provide a review and evaluation of the 1986 Boyle design for the Sloan Channel from Owens Avenue to the Las Vegas Wash using current design as criteria as set forth in the CCRFCD Manual.

- Present a hydrologic analysis of the watershed which contributes storm runoff directly to this reach of the Sloan Channel. The hydrologic analysis will identify points of local inflow into the Sloan Channel within the project limits and quantify the flows at these points.

- Provide recommendations for the following:

  - the adequacy of the previous design to convey the design flows of 3,300 cfs with freeboard and 6,000 cfs without freeboard;

- mitigation measures to protect the channel improvements from local inflows;
- the adequacy of the previous design to meet current design standards;
- the need for additional Special Services as described in Section 2.03 of the Professional Engineering Services Contract for this project.

III. SUMMARY OF UPDATED GEOTECHNICAL INVESTIGATION

As part of this predesign memorandum, the geotechnical investigation for this reach of the Sloan Channel was updated. Converse Consultants Southwest, Inc. (Converse) was employed to update their geotechnical investigation which had been prepared for the 1986 Boyle design of this project. The updated geotechnical report is included in this predesign memorandum as Appendix A.

Converse performed three (3) additional exploratory borings as part of the updated soils report. The subsoils encountered in this update and the previous investigation generally consisted of soft to firm silts and clays overlying very stiff clays and silts, and medium dense sands. The laboratory test results yield soils that are compressible, have low to moderate dry densities, low to high degree of solubility, a low to high clay swell potential, low to moderate chemical heave potential, and contain sulfate salts.

Groundwater was encountered in the three borings performed with the update and several locations in the original investigation. It should be noted that the three borings performed with the update were located south of Charleston Boulevard. These boring locations were selected to identify the extents of groundwater in the reach of this project south of Charleston Boulevard in light of the higher than normal precipitation in the year proceeding the preparation of this report.

No additional geotechnical services for design are anticipated at this time.

IV. REVIEW OF PREVIOUS DESIGN

The 1986 Boyle design of the Sloan Channel from Owens Avenue to the Las Vegas Wash was prepared prior to the publication of the CCRFCD Hydrologic Criteria and Drainage Design Manual (Manual). The Manual has established design parameters for concrete lined channels constructed within the Clark County area. The 1986 design for the Sloan Channel was reviewed using the currently accepted CCRFCD criteria and the updated geotechnical report. The following is a summary of the evaluation of the 1986 Boyle design using current criteria.

- Most of the channel lining (approximately 15,990 feet) is shown to have a side slope of greater than 2:1 (H:V). Section 705.7.1.1 b) of the Manual lists a maximum side os slope of 2:1 (H:V) for non-structurally reinforced walls.

- The longitudinal and transverse reinforcement of the channel lining shown on the Boyle design does not meet current criteria as set forth in Section 705.7.1.5 b) of the Manual. The Boyle design calls for #5 bars at 12-inch spacing for longitudinal reinforcement, and #5 bars at 18-inch spacing for transverse reinforcement. This equates to a steel area to concrete cross sectional area ratio of 0.0043 for the longitudinal reinforcement of 0.0028 for the transverse reinforcement. The Manual requires a ratio of longitudinal steel area to concrete cross sectional area greater than 0.005 (but not less than #4 rebar at 12-inch spacing). The transverse steel area to concrete cross section is to be greater than 0.0025 (but not less than #4 rebar at 12-inch spacing). To meet current CCRFCD Design Standards, the minimum longitudinal steel required for the 6-inch lining shown on the Boyle drawings needs to be #6 rebar at 12-inch spacing, and the transverse steel needs to be #4 rebar at 12-inch spacing.

- The 1986 design does not require the top 12-inches of earth surface within 10-feet of the concrete channel lip to be compacted to at least 90 percent of the

maximum density per ASTM 1557 as required in Section 705.7.1.6 d) of the Manual.

- The Boyle design does not include longitudinal or transverse cutoff walls. The Manual requires that transverse cutoff walls shall be constructed at a maximum spacing of 90 feet and shall extend a minimum of 3-feet below the bottom of the concrete lining. Longitudinal cutoff walls along the top of the bank at a minimum depth of 3-feet are also required by the Manual. However; due to the fact that much of the west side of the channel is protected from the surface inflows by existing masonry walls, the longitudinal cutoff wall could be omitted for portions of the west side of the channel.

- Maintenance access per Section 707.2 of the Manual appears to be met. Since the channel top width is greater than 30-feet, the maintenance road can be located in the bottom of the channel. The 1986 design, apparently, utilized this concept.

- Ladder-type steps per Section 707.3 b) of the Manual need to be incorporated into the channel design.

- The updated geotechnical investigation recommends "Concrete panels on the channel sides and bottom be supported by a blanket of granular filter material that is a least 6-inches and 12-inches thick, respectively." The 1986 design shows a 6-inch blanket of Type 2 drain backfill throughout.

Considerations for development which has occurred or is presently ongoing along the Sloan Channel alignment need to be made. Numerous residential developments have been, or are being constructed along the channel alignment. A number of these developments discharge storm flows directly into the Sloan Channel via storm drains and/or surface outlets. Design consideration should be made to incorporate the features constructed after 1986 into overall design of the channel.

The majority of the development which has taken place since the 1986 design was prepared is located south of Charleston Boulevard. Peachtree, a master planned development on the east side of the Sloan Channel, will discharge approximately 1,200 cfs into the Sloan Channel via a concrete lined channel to be located 1,200 feet north of the Sahara Avenue alignment.

Developments on the west side of the Sloan Channel south of Charleston Boulevard, including Sunrise Valley Garden Homes, Sunrise Valley Unit 8, and Stonebridge D2A, also discharge local storm flows into the Sloan Channel via surface inlets.

The access ramp/surface inlet shown at Station 41+21 should be moved. An apartment development adjacent to this location has intercepted and diverted the surface flows which formerly entered the channel at this location. This access ramp/surface inlet could be relocated approximately 250-feet north at the northern boundary of the aforementioned apartment development and provide surface flow access the channel.

An existing wash intersects the Sloan Channel from the west just south of Stewart Avenue. The 1986 design shows this wash being blocked by the construction of the channel improvements. This wash bisects an undeveloped parcel of land. As will be presented in the section of this Predesign Memorandum entitled Hydrology, a considerable amount of storm runoff (580 cfs in a 100-year storm) presently is conveyed to the Sloan Channel across the undeveloped parcel in this wash. The undeveloped parcel does not have improvements on Stewart Avenue to contain local storm flows within the Stewart Avenue right-of-way. Considerations must be given to either containing storm flow along Stewart Avenue, or providing means to safely introduce flows from this wash into the Sloan Channel.

Since the 1986 design for the Sloan Channel was prepared, the CCRFCD Master Plan (October 1986) and the Master Plan Update (August 1991) have been published. The 1991 Master Plan Update identifies existing and proposed drainage

facilities of regional significance for the Las Vegas Valley area. A review of the Master Plan Update shows existing and proposed collector systems from the east tying into the Sloan Channel. The collector system intersect the Sloan Channel at the major roadway crossings within the project area. The 1991 Master Plan Update lists the following collector facilities (see Figures F-11 and F-15 of the Master Plan Update):

Owens Avenue	60-inch RCP
Washington Avenue	90-inch RCP
Bonanza Road	72-inch RCP (existing)
Stewart Avenue	66-inch RCP
Charleston Boulevard	20 ft. W, 6.5 ft. D, rip-rap channel

The existing facilities and the proposed facilities shown on the Boyle Drawings at these locations are as follows:

Owens Avenue	54-inch RCP (proposed)
Washington Avenue	60-inch RCP stub (existing)
Bonanza Road	72-inch RCP (existing)
Stewart Avenue	43" x 68" HE RCP (54" equiv. stub) (existing)
Charleston Boulevard	48" x 91" in HE RCP (72" equiv.) (existing)

All of the existing facilities and proposed facilities shown on the Boyle drawings are located in the downstream transition structures of the RCB culverts or bridges at these locations. Accommodations could be made to update existing facilities that differ from the Master Plan facilities as part of this project. However, the Master Plan is only a guide, and the facilities at these locations may change when detailed drainage studies and designs are prepared.

Utilities

No utility conflicts are anticipated with the construction of this project. GCW preliminary utility research indicates that, with the exception of the future bridge crossing of Sahara Avenue at the Sloan Channel, all existing utilities are located beneath the existing bridge and RCB culvert structures at major roadway crossings. However, we have not received written responses from all of the utility companies at this time.

An inverted sewer siphon is present under the Sloan Channel in the Sahara Avenue alignment. This inverted siphon was designed to accommodate the future improvements to the Sloan Channel and the future RCB culvert at Sahara Avenue. The top of pipe for the siphon is approximately 6-feet below the proposed invert of the channel.

The Clark County Sanitation District (CCSD) has indicated that the Betty Lane Relief Sewer is currently being designed. The Relief Sewer will be located in the general vicinity of Owens Avenue and the Sloan Channel. The Betty Lane Relief Sewer will approach the Sloan Channel from the east in Owens Avenue. The relief sewer will need to cross the Sloan Channel in the vicinity of Owens Avenue. The sewer line crossing could most easily be accomplished just downstream of the existing concrete transition structure associated with the Owens Avenue RCB culvert. Provided that the sewer line is constructed prior to or in conjunction with the Sloan Channel improvements, the existing RCB and transition structure at Owens Avenue can remain in place. The CCSD has indicated that the construction of this relief sewer is scheduled for late 1993. The design and/or construction of the Sloan Channel will need to be coordinated with the CCSD and their contractor.

Right-of-Way

Preliminary right-of-way research indicates that continuous right-of-way and easements of sufficient width exists to construct the proposed basic channel improvements throughout the project area with the exception of an 873 foot long portion located immediately north of Sahara Avenue. This needed right-of-way is a portion of an undeveloped 25 acre parcel identified by APN 320-160-005.

Additional minor right-of-ways and/or construction easements requirements may be identified during the design phase of the project.

The Record-of-Survey, and right-of-way research are currently ongoing and will be submitted with the final Predesign Memorandum as per Section 2.02 I of the Professional Engineering Services Contract.

V. HYDROLOGY

The purpose and scope of the Hydrology section of this report was to establish the localized inflows to the Sloan Channel between Owens Avenue and the Las Vegas Wash. A detailed explanation of the model and the modeling techniques and calculations are contained in Appendix "B" of this report.

Methodology

The hydrologic methods used to establish the localized inflows to the Sloan Channel between Owens Avenue and Las Vegas Wash are based on methods established in the "Clark County Regional Flood Control District Hydrologic Criteria and Drainage Manual" (Manual). The hydrologic model utilized in this study is an HEC-1 flood hydrograph package developed by the U.S. Army Corps of Engineers, Hydrologic Engineering Center.

The rainfall relationships were generated using adjusted rainfall and a 6 hour SDN-3 distribution curve. A detailed explanation of the methodology and modeling is contained in Appendix "B."

Analysis

Two conditions were analyzed. Alternative 1 assumes existing conditions with ultimate buildout within the drainage area. Alternative 2 is the ultimate development condition and assumes future CCRFCD Master Plan facilities in place. Two detention basins have significant impact to the local runoff generated between Owens Avenue and the Las Vegas Wash. These are identified as facilities SLW/0154 and SLST/0169 on Figures F-12 and F-16 of 1991 Flood Control Master Plan Update. The facilities dampen peak flows generated on the Sunrise Mountain and route flows down Washington Avenue and Stewart Avenue into the Sloan Channel.

Figure No. 3 shows locations where inflow are calculated into the channel. Peak flow values for Alternative 1 and Alternative 2 are contained in Tables 1 and 2, respectively.

11	--	101	208	28	63

*See Figure 3

The detailed HEC-1 model used for this analysis only identified those storm flow that enter the Sloan Channel south of Owens Avenue. The accumulative impact of the inflows generated by the model suggest that, at least under existing conditions in the local watershed, the local inflows may control the 100-year peak storm flow in the Sloan Channel south of Washington Avenue. Therefore, a preliminary hydrologic analysis of the Sloan Channel watershed from Carey Avenue to the Las Vegas Wash was prepared. The model indicates that the local inflows will exceed the design flow of 3,300 cfs as far north as Bonanza Road. The peak flows in the channel generated by the local inflows for existing and ultimate conditions are listed in Table 3 below:

TABLE 3
SLOAN CHANNEL
LOCAL 100-YEAR PEAK FLOWS

Location	Existing Condition (Carey to LV Wash)	Ultimate Local Inflows with Regional Facilities (Carey to LV Wash)
Washington Ave.	3100	1340
Bonanza Road	3400	1640
Stewart Avenue	3660	2010
Charleston Blvd.	4225	2250
Sahara Avenue	4900	3230
Las Vegas Wash	4975	3300

The proposed channel sections will convey the calculated flows within current design standards. Preliminary calculations indicate that the Charleston Bridge has capacity to pass a flow of 4,225, but the culvert at Stewart Avenue may experience some minor overtopping (approximately 50 cfs) for a flow of 3,660 cfs. The County may want to prepare a detailed study of the inflows to the Sloan Channel south of Carey Avenue (the outfall of the Confluence Detention Basin) to determine if the future bridge structure at Sahara Avenue needs to be sized for a flow greater than 3,300 cfs. As Table 3 indicates, ultimately, Regional facilities in the local watershed will reduce the local inflows to less than the design flow of 3,300 cfs.

VI. HYDRAULICS

Methodology

Water surface profiles for the Sloan Channel were calculated using the U.S. Army Corps of Engineers HEC-2 "Water Surface Profiles" computer program. Profiles were calculated assuming both supercritical and subcritical flow regimes. Bridges and culverts were modeled using the special bridge subroutine. Slope and channel

configurations are based on the Boyle drawings provided by the Clark County Public Works Department.

Channel stationings were taken from the above mentioned design drawings. Cross section numbers in the HEC-2 model correspond to the channel stationing. Cross sections were taken approximately every 300 feet with additional sections taken at grade breaks, transitions, bridge crossings and culvert crossings. Per contract requirements, models were prepared for both a 3,300 cfs and a 6,000 cfs flow. The calculated water surface elevation for the two flow models are contained in Tables 4 and 6.

Analysis

In general, it was determined that the typical channel sections proposed by the 1986 Boyle drawings have sufficient capacity to convey the 3,300 cfs, and meet current CCRFCD requirements for depth, velocity and freeboard. However, it was found that the existing culvert crossings at Stewart Avenue and Bonanza Road lack capacity to convey the 3,300 cfs flow with freeboard. The models suggest that the 3,300 cfs will pass through the culvert crossings at these locations in a pressure flow condition. The bridge crossings at Washington Avenue and Charleston Boulevard had sufficient capacity to pass 3,300 cfs with freeboard. A tabulation of the channel and bridge flow depths are contained in Table 5.

With a flow of 6,000 cfs in the channel, both the culvert crossings at Bonanza Road and Stewart Avenue and the bridge crossings at Washington Avenue and Charleston Boulevard are overtopped. The amount of flow overtopping in the case of the culvert crossing is significant (1,700 to 2,100 cfs) and exceeds the depth velocity criteria allowed within the CCRFCD Manual. At Washington Avenue and Charleston Boulevard bridges, the overflow is minimal. The majority of the proposed channel will meet CCRFCD Manual requirement for freeboard and will

convey the 6,000 cfs flow except where the bridge and culvert crossings lack capacity. The data for the 6,000 cfs flow is contained in Table 6.

VII. COST ESTIMATE

A preliminary cost estimate for the construction of this project is presented in Table 8. The cost estimate was prepared for two phases of construction. The limits of Phase I are from Owens Avenue to Stewart Avenue. Phase II extends from Stewart Avenue to the Las Vegas Wash.

The quantities shown for Overexcavation, are based on roughly 2 feet of overexcavation below the invert and benched excavation on the sides as described in the geotechnical report. The quantities for Imported Drain Backfill, and Recompact Native Material are based on 6 inches of drain backfill under the channel lining and the balance of the excavated prism being filled with recompacted native material. Chain-link fence quantities were estimated for portions of the channel with no adjacent, existing development. Channel lining quantities are shown in square feet. The unit price was adjusted to account for incidental items such as cutoff walls and access ramps.

VIII. RECOMMENDATIONS AND CONCLUSIONS

The channel section proposed in the 1986 Boyle design has adequate capacity to safely convey the design flows of 3,300 cfs and 6,000 cfs with freeboard except at the bridge and culvert crossings. The existing RCB culverts and bridges within the project limits have adequate capacity to convey the design flow of 3,300 cfs without overtopping. However, all of the culverts and bridges are overtopped for the design flow of 6,000 cfs. The flows that overtop the bridges at Washington Avenue and Charleston Boulevard are relatively minor (319 cfs and 419 cfs, respectively) in respect to the design flow of 6,000 cfs. These flows could be diverted back into the Sloan Channel via a surface inlet constructed within the Sloan Lane right-of-way.

The overtopping flows at the culverts at Bonanza Road and Stewart Avenue for the flow of 6,000 cfs are significant (2,074 cfs and 1,727 cfs, respectively). However, the Confluence Detention Basin is currently under design and is scheduled for a construction start in 1994. The Confluence Detention Basin will reduce the design flow for the Sloan Channel to 3,300 cfs. Based on this information, the detention basin will be in place before the culverts at Bonanza Road and Stewart Avenue could be redesigned and reconstructed. Therefore, the existing facilities are recommended to be left in place.

Provisions to accept local inflows into the Sloan Channel need to be incorporated into the design drawings. Significant inflows will be incurred at the points shown on Table 1 and Table 2. Future Master Plan facilities will eventually reduce the magnitude of the local inflows at some points. The surface inlets shown in the 1986 design were most likely sized for flows determined using hydrologic criteria which is not currently accepted. The surface inlets need to be reanalyzed to account for the updated local inflows and flow patterns presented in this memorandum. Major surface inlets need to be constructed on the east side of the channel at Owens Avenue and Washington Avenue, on the east and west side of the channel at Stewart

Avenue, and on the east side of the channel at Charleston Boulevard. Major surface inlets at existing roadway crossings should be similar in design to the existing surface inlet at Bonanza Road. This inlet consists of a warped pavement section for Sloan Lane adjacent to the Sloan Channel (and a depressed section of curb and gutter and sidewalk to act as the surface inlet. Minor surface inlets or, inlets at inflow points not associated with the major roadway crossing, should be similar to the surface inlets shown on the 1986 design. These inlets will consist of a depressed section of channel lining and upstream erosion protection to prevent undermining of the channel lining. The size and configuration of each inlet will be determined by the amount of inflow, allowable inlet velocities, and local topographic features. Provisions also need to be made to protect the proposed channel improvements from storm flows which are discharged directly into the Sloan Channel from adjacent residential developments.

The 1986 Sloan Channel design does not meet the currently accepted CCRFCD criteria for open channel design for the following items: steel area, transverse and longitudinal cutoff walls, safety ladders, and side slopes.

Based on work performed in the preparation of this Predesign Memorandum, the following recommendations are made:

- Based on the magnitude of the design flows for the Sloan Channel, the portion of Sloan Channel from Owens Avenue to the Las Vegas Wash confluence must be improved as a fully-lined, concrete trapezoidal channel. The existing, earth-lined channel section does not have adequate capacity to safely convey the design flows. The recommended improvements will protect the existing bridge and culvert structures at the major roadway crossings and will protect the surrounding residential developments.

- New design drawing for the Sloan Channel should be prepared that will incorporate current design standards, the updated soils information, and

current development conditions. The updated channel design will include 2:1 (H:V) side slopes, transverse and longitudinal cutoff walls, safety ladders, and steel areas per CCRFCD criteria. Portions of the longitudinal cutoff wall on the west side of the channel could be omitted where the channel will be protected from surface inflows by existing masonry walls. A low flow channel will also be incorporated into the channel design in order to contain nuisance flows in the center of the channel.

- No new bridges or modifications to existing culvert structures are recommended at this time. The existing culverts and bridges have capacity to convey the design flow of 3,300 cfs within the proposed channel sections. Regional facilities will soon be constructed that will limit the upstream inflow into this portion of the Sloan Channel to 3,300 cfs.

- The existing storm drain stubs for future Master Plan storm drains should not be constructed or reconstructed at this time, but rather should be placed at such a time that the future Master Plan facilities are designed.

- Surface runoff approaching the Sloan Channel from the west at Stewart Avenue can be introduced to the Sloan Channel either by perpetuating the existing flow pattern across an undeveloped parcel, or by constructing a channel parallel to Stewart Avenue along the frontage of the vacant parcel to the Sloan Channel. Presently, major storm flows in Stewart Avenue from the west are introduced into the Sloan Channel via an existing wash which bisects an undeveloped parcel located in the southwest quadrant of Sloan Channel and Stewart Avenue. The existing wash could be partially filled and regraded in order to improve the hydraulics of the confluence with Sloan Channel. The invert of the wash should be raised sufficiently so that minor flows conveyed in the Sloan Channel would not inundate this property. The wash should be concrete lined within the right-of-way for Sloan Channel with a concrete cutoff wall at the right-of-way line to prevent undermining the lining. An

easement would be required through this property to construct these improvements.

Runoff in Stewart Avenue could also be conveyed into the Sloan Channel by construction an interceptor channel along the south side of Stewart Avenue adjacent to the vacant parcel. In this option, the channel would act as a side weir to remove flows from Stewart Avenue. This option would require the construction of a warped pavement section in Stewart Avenue to force flows into the interceptor channel. The exact size and configuration of the channel can be determined when more detailed topographic data is available. Preliminary estimates indicated that a 20-foot wide, rectangular, concrete-lined channel at a slope of 0.4% could convey the 100-year flow of 580 cfs at a depth of 2.8 feet. The construction of this channel would require the acquisition of some right-of-way from the vacant parcel.

The construction of the channel along the south side of Stewart Avenue is recommended for construction. This channel will provide a one-time solution to the introduction of surface flows into the Sloan Channel at this location. Whereas, the improvements to the existing wash across the vacant parcel would only be a temporary solution. In the future, if an upsized storm drain is constructed within Stewart Avenue, it could be connected to the proposed channel.

The HEC-1 model prepared to identify local inflows into the Sloan Channel within the project limits for existing conditions suggests that local inflows into the Sloan Channel may exceed the design flow of 3,300 cfs in the middle and lower reaches of the project. A preliminary analysis of the entire watershed that contributes local inflows to the Sloan Channel south of the Confluence Detention Basin (Carey Avenue) indicates that the accumulation of local inflows into the channel will exceed 3,300 cfs as far north as Bonanza Road. A detailed hydrologic analysis of the local watershed for the Sloan Channel

north of Owens Avenue is beyond the scope of this Predesign Memorandum. While it appears that the existing structures will convey these flows, Clark County may want to perform a detailed hydrologic analysis for the Sloan Channel watershed to insure that the future culvert structure at Sahara Avenue is adequately sized.

APPENDIX "B"

HYDROLOGY

Hydrologic Methodology

The hydrologic methods used are in accordance with the adopted "Clark County Regional Flood Control District Hydrologic Criteria and Drainage Design Manual," (Manual).

Hydrologic Model

The hydrologic model utilized in this study is the HEC-1" Flood Hydrograph package" developed by the U.S. Army Corps of Engineers Hydrologic Engineering Center.

HEC-1 is a rainfall runoff event simulation model utilizing an hydraulic components to simulate the surface runoff response of a drainage area to precipitation.

Computed hydrographs were routed using kinematic wave routing technique.

Precipitation

The Manual was used to establish point precipitation values, rainfall distribution and storm frequency.

That western portion of the drainage area, west of Hollywood Drive (see Figure B1), is in the McCarran Airport rainfall area as outlined by the Manual. The point rainfall depths for the six hour, 10-year and 100-year storm intervals were taken directly from Table 505 of the Manual. For the easterly portion of the drainage area, the point precipitation values were established from the NOAA precipitation Frequency Atlas (1973). The NOAA precipitation values were then adjusted by the recommended correction factors to develop point rainfall depths for storm events that best simulate the hydrologic area. The six-hour storm has been selected in accordance with the Manual.

Since the drainage area for the project is less than 10 square miles, a SDN 3 design storm distribution with a 3 minute time increment was selected for use in the HEC-1 computer model.

CURVE NUMBER

The soils information for the study area and the project watershed was obtained from the SCS Soil Survey of Las Vegas Valley Area. This survey delineates families of soil types and the hydrologic soil group of each family. Figure B2 shows the study site on a portion of the soil map for the area. An examination of this map shows a mixture of several types of soil, generally "D" type on the steeper slopes and "A", "B" and "C" types on the lower reaches of the drainage basins.

The curve numbers for each soil group were selected from Table 602 of the Manual for the ultimate development conditions.

Drainage Area

The drainage basins were determined with the use of U.S. Geological Survey 7-1/2 minute quad maps, 400 scale aerial photos, 200 scale County topo maps, field investigations and 100 scale onsite topographic maps. A planimeter was then used to determine the basin areas. The drainage basins are shown on Figure B1.

Lag Time

The Manual recommends that for drainage basins less than one square mile, the lag time be determined using the following equation:

$$\text{Lag} = 0.6\, t_c$$

where t_c is the time of concentration in hours and is calculated by the following equation:

$$t_c = t_i + t_t$$

where

t_i = initial inlet or overland flow time (minutes)

t_t = travel time in ditch, channel, gutter, etc. (minutes)

initial overland flow time was calculated by the following equation:

$$t_i = 1.8\,(1.1 - K)L_o^{1/2}/S^{1/3}$$

(for detailed explanation, see Section 600 CCRFCD Manual).

For this study, time travel (t_t) was computed by using the channel length (i.e., gutter length) divided by street flow velocity for the respective slope. The total travel time was computed as the sum of travel time for each basin. Therefore, the t_c was computed as the initial overland flow time plus travel time, and the lag time as $0.6\ t_c$.

Flood Hazard Designation

The Special Flood Hazard Areas for Clark County, Nevada are outlined in the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRM), dated September 29, 1989. In reviewing Community Panel No. 320005 1250B and 1025B, portions of the drainage basin are located within a designated Special Flood Hazard Area (see Figure B3). However, there has been significant development within the drainage basin since the publication of the FIRM in 1989. LOMR's for the individual subdivisions may have eliminated all or part of the Special Flood Hazard Areas.

Analysis

Figure B1 outlines the contributing drainage area to the Sloan Channel (between Owens Avenue and the Las Vegas Wash confluence) under ultimate developed conditions. To

model the storm flow, the study area was divided into two major areas. Area No. 1 was analyzed in the study entitled "Conceptual Master Drainage Report for Lewis Homes - Orchards," January 1992 by Pentacore Engineering. The study and the resulting flows into the Sloan Channel were accepted by Clark County Public Works. Area No. 2 was divided into drainage areas east and west of the Sloan Channel. The drainage area on each side was in turn, subdivided into subdrainage areas. The drainage subbasin characteristics are contained in Table B1.

The HEC-1 model was used to analyze the study area and consists of data generated for Area No. 2 and data incorporated from the above mentioned drainage report for Area No. 1. Two HEC-1 alternatives are analyzed for the total study area. Alternative 1 assumes existing conditions within the project watershed without any storm water detention in the upper reaches of the watershed. In this alternative, a portion of the flow from Subbasins SB10 and SB11 (see Figure B1) is diverted through SB15 to Charleston Boulevard as occurs in the existing conditions. The resulting flows and related data at points of interest for Alternative 1 are contained in Table B2.

Alternative 2 assumes ultimate conditions with CCRFCD Master Plan facilities in place. Two detention basins that impact this reach of the Sloan Channel are identified in Figures F-12 and F-16 of the 1991 Master Plan Update. Facilities Nos. SLSW/0154 and SLST/0169 have a significant impact on the routing and peak flow rates in the localized watershed. In Alternative 2, the runoff from Subbasins SB10 and SB11 flows along Stewart Avenue to Sloan Channel. The resulting flows and related data at points of interest for Alternative 2 are shown in Table B3.

Poor condition (grass cover < 50%)		68	79	86	89
Fair condition (grass cover 50% to 75%)		49	69	79	84
Good condition (grass cover > 75%)		39	61	74	80
Impervious areas:					
Paved parking lots, roofs, driveways, etc. (excluding right-of-way)		98	98	98	98
Streets and roads:					
Paved; curbs and storm sewers (excluding right-of-way)		98	98	98	98
Paved; open ditches (including right-of-way)		83	89	92	93
Gravel (including right-of-way)		76	85	89	91
Dirt (including right-of-way)		72	82	87	89
Western desert urban areas:					
Natural desert landscaping (pervious areas only)[4]		63	77	85	88
Artificial desert landscaping (impervious weed barrier, desert shrub with 1- to 2-inch sand or gravel mulch and basin borders)		96	96	96	96
Urban districts:					
Commercial and business	85	89	92	94	95
Industrial	72	81	88	91	93
Residential districts by average lot size:					
1/8 acre or less (town houses)	65	77	85	90	92
1/4 acre	38	61	75	83	87
1/3 acre	30	57	72	81	86
1/2 acre	25	54	70	80	85
1 acre	20	51	68	79	84
2 acres	12	46	65	77	82
Developing urban areas					
Newly graded areas (pervious areas only, no vegetation)[5]		77	86	91	94

[1]Average runoff condition, and $I_a = 0.2S$.
[2]The average percent impervious area shown was used to develop the composite CN's. Other assumptions are as follows: impervious areas are directly connected to the drainage system, impervious areas have a CN of 98, and pervious areas are considered equivalent to open space in good hydrologic condition. CN's for other combinations of conditions may be computed using figure 603
[3]CN's shown are equivalent to those of pasture. *Composite CN's may be computed for other combinations of open space cover type.*
[4]Composite CN's for natural desert landscaping should be computed using figure 603 based on the impervious area percentage (CN = 98) and the pervious area CN. The pervious area CN's are assumed equivalent to desert shrub in poor hydrologic condition.
[5]Composite CN's to use for the design of temporary measures during grading and construction should be computed using figure 603 based on the degree of development (impervious area percentage) and the CN's for the newly graded pervious areas.

Revision	Date

PRECIPITATION ADJUSTMENT RATIOS

Recurrence Interval	Ratio to NOAA Atlas 2
2-year	1.00
5-year	1.16
10-year	1.24
25-year	1.33
50-year	1.39
100-year	1.43

NOTE:
1. Multiply the values obtained from the NOAA Atlas 2 by the above ratios to obtain the adjusted precipitation values.
2. NOAA Atlas 2 values for use with TR-55 shall not be adjusted by the above ratios.
3. Tables 505 and 506 require no adjustments.

Revision	Date

SIX HOUR DEPTH-AREA REDUCTION FACTORS

Drainage Area (Square Miles)	Six-Hour Depth-Area Reduction Factor
0.0	1.00
0.5	0.98
1.0	0.97
2.0	0.93
4.0	0.91
6.0	0.90
8.0	0.88
10.0	0.86
20.0	0.79
30.0	0.74
50.0	0.68
100.0	0.60
150.0	0.55
200.0	0.51
300.0	0.46
400.0	0.42
500.0	0.39

NOTES:
1. A graphical representation of these factors is presented in Figure 514.
2. Consult with the local entity and/or the CCRFCD for guidance in using the Depth-Area Reduction Factors for drainage areas greater than 200 square miles.

FLOOD HYDROGRAPH PACKAGE HEC-1 (IBM XT 512K VERSION) -FEB 1,1985

U.S. ARMY CORPS OF ENGINEERS, THE HYDROLOGIC ENGINEERING CENTER, 609 SECOND STREET, DAVIS, CA. 95616

****

THIS HEC-1 VERSION CONTAINS ALL OPTIONS EXCEPT ECONOMICS, AND THE NUMBER OF PLANS ARE REDUCED TO 3

HEC-1 MODEL FOR 10-YR. STORM WITHOUT DETENTION IN LOCAL WATERSHED

Hydraulic Analysis

The water surface profile for the Sloan Channel was computed for supercritical and subcritical flow conditions beginning with critical flow depth approximately 137 feet downstream from the Owens Avenue RCB culvert. The channel stationing starts at 1+37.48 per the 1986 channel design drawing Boyle provided by Clark County Public Works.

The cross section locations are taken from the above mentioned design drawing. The cross section numbers in the HEC-2 model correspond to the channel stationing. Cross sections were taken at 300 foot intervals through the length of the channel. Additional sections were taken at grade breaks, transitions and culvert crossings. The channel cross section geometry and channel flow line were matched as closely as possible to the Boyle design mentioned above.

The design flows to be used in the HEC-2 model were established by the contract as 3,300 cfs and 6,000 cfs.

To evaluate the existing culverts and bridges, the special bridge routine was selected.

The computed water surface elevations and hydraulic characteristics of the channel 3,300 cfs and 6,000 cfs are shown in Table C1 and Table C2. A printout of each HEC-2 model run is also contained in this Appendix.

Channel Capacity

Per existing design drawings from Station 0+00 to Station 105+74, and from Station 125+30 to end of channel, the channel bottom width is 60 feet, the side slopes are 1.5:1 (H:V), and the depth varies from 6 feet to 7.5 feet. From Station 108+30 to Station 124+30 the channel bottom width is 70 feet, the side slopes are 1.5:1 (H:V), and the depth varies from 5.3 feet to 7.5 feet. The analysis shows the design flow of 3,300 cfs is contained in the typical channel section and meets the CCRFCD freeboard requirements. The invert slope of the channel is sufficient to maintain supercritical flow for both design

flows. The existing bridges and culverts will cause a backwater effect immediately upstream from these structures. The backwater effect will cause the flow to pass from supercritical to subcritical for a short distance upstream from the structures. The channel flows do not have sufficient energy to sustain a strong hydraulic jump. An undular jump (Fr = $1 < x < 1.7$) can be expected upstream from the bridges and culverts.

The super-elevation of the water surface for both design flows caused by the reverse curve in the channel alignment located south of Charleston Boulevard was calculated per Equation 730 of the Manual. The calculated super-elevations in the reverse curve for 3,300 cfs and 6,000 cfs is on the order of 0.6 feet and 1.0 feet, respectively.

The design flow of 6,000 cfs is contained within a typical section of the Sloan Channel without freeboard.

Bridge and Culvert Capacity

To evaluate the bridge and culvert capacities, the special bridge routine was used in the HEC-2 analysis. The design flow of 3,300 cfs passes through the Washington and Charleston bridges as Class B low flow, and passes through the Bonanza Road and Stewart Avenue culverts as pressure flow.

The design flow of 6,000 cfs passes through and overflows the above mentioned bridges and culverts as pressure and weir flow. The restriction of flow at the bridges and culverts will cause a backwater upstream from these structures, and will cause overflow from the channel onto adjacent properties and streets.

A summary of bridge information and ponding depth is shown in Table C3 and Table C4 for the 3,300 cfs and the 6,000 cfs design flows.

* CHANNEL TYPICAL CROSS SECTIONS

DATE _____

CLIENT CCPW JOB NO 500.710 CALC BY NGL

DESCRIPTION SLOAN CHANNEL - SUPERELEVATION CHECKED BY _____

SUPERELEVATION FOR REVERSE CURVES SOUTH OF CHARLESTON

EQ. 730 FROM THE CCRFCD MANUAL

$S_e = \frac{V^2 T_W}{g r}$ WHERE: S_e = SUPERELEVATION (ft)

T_W = TOP WIDTH OF FLOW (ft)

g = ACCEL. OF GRAVITY (ft/sec^2)

r = RADIUS OF CURVE (ft)

*CURVE 1 (STA 107+75.83 TO STA 111+91.30)

$r = 853.02$ ft

3300 cfs (X-SECT 10900)

$V = 14.57$ fps

$T_W = 80.97$ ft

$S_e = \frac{(14.57)^2 (80.97)}{(32.17)(853.02)} = 0.62$ ft

6000 cfs

$V = 17.74$ fps

$T_W = 86.14$ ft

$S_e = \frac{(17.74)^2 (86.14)}{(32.17)(853.02)} = 0.99$ ft

(CON'T.)

DISTRICT CONCURRENCE: CIBOLA (HTE 94-25236)

Dear Mr. Thompson:

The District has reviewed the Technical Drainage Study dated November 19, 1994, Addendum No. 1 dated December 30, 1994, Addendum No. 2 dated January 15, 1995, and Addendum No. 3 dated February 6, 1995, for the above captioned project as submitted by Ray Novatney, P.E. In addition the District is in receipt of the Conditional Letter of Acceptance from Clark County Public Works dated February 24, 1995.

The District concurs with the acceptance of this Technical Drainage Study by Clark County Public Works. As noted in the Conditional Letter of Acceptance from the County, the Clark County Public Works Design Division must concur with the proposed connection to the Sloan Channel.

The District's review of this project was limited to issues of Regional Flood Control Significance as defined in the Uniform Regulations for the Control of Drainage. As noted in the study the site resides in a Special Flood Hazard Area (SFHA) designated as "Zone A" per the effective Flood Insurance Rate Map (FIRM). Therefore the consultant should be advised that this acceptance does not serve to amend the FIRM or remove the SFHA designation.

Please be aware that as additional information becomes available and/or restudies of Flood Insurance Studies are performed, the information submitted by Ray Novatney, P.E. may be superseded. Compliance with the regulatory elements and design standards specified in the Uniform Regulations for the Control of Drainage does not imply a guarantee that

301 E. Clark Avenue, Suite 301 • Las Vegas, Nevada 89101

properties will be free from flooding or flood damage. No liability is assumed by the District, its officials, or employees for the information, data or conclusions presented by the consulting engineer. We therefore make no warranties, either expressed or implied, in conducting this review.

Dear Sirs:

Re: Willdan/Clark County Public Works Plan Review Contract
Technical Drainage Study *for Cibola aka Magnolia Estates* **(1530)**
Study Dated: November 19, 1994
First Addendum Dated: December 30, 1994
Second Addendum Dated: January 15, 1995
Third Addendum Dated: February 6, 1995
Location: Southwest corner of Stewart Avenue and Sloan Channel (Sec. 33, T. 20 S., R. 62 E.)
H.T.E.# 94-25236

The referenced **Technical Drainage Study** has been reviewed and is accepted as complying with minimum improvement standards. As set forth in the subject drainage study, the following measures will be taken to mitigate flood hazards:

1. The site shall be graded with respect to drainage as shown on "Grading Plan for Magnolia Estates," signed and sealed by Ray Novatney, P.E., on November 18, 1994;

2. The following drainage facilities shall be constructed:

   a. A concrete lined channel located on the south side of Stewart Avenue. The channel will begin at the Battle Mountain Drive intersection and will extend east to the project entrance. The channel will include a steel post metal beam guardrail at the west channel flume, and a 12 foot chainlink gate for access at the extreme west end. The street side of the channel will include a traffic barrier wall with chainlink fence a minimum of 6 feet tall. The property side of the channel will include a minimum 6-foot-tall block screen wall. The channel will be vertical concrete lined, 3.4-foot-deep, 8-foot-wide, located within a 9-foot-wide public drainage easement

COMMISSIONERS
Jay Bingham, Chairman • Don Schlesinger, Vice-Chairman
Paul J. Christensen, Thalia M. Dondero, Yvonne Atkinson Gates, Karen Hayes, Bruce L. Woodbury
Donald L. "Pat" Shalmy, County Manager

b. A box culvert extending from the east end of the channel to the Sloan Channel. The box culvert will be 187 feet long, 8 feet wide by 3.5 feet tall, located within a 9-foot-wide underground public drainage easement

c. A connection of the proposed 8-foot-wide x 3.5-foot-tall RCB to the existing Slogan Channel

d. A 20-foot-long Type A drop inlet located east of the site entrance, connected to the 8-foot-wide x 3.5-foot-high RCB with 2 LF of 30-inch RCP

e. An onsite drainage system at the south side of the project within a 10-foot-wide private drainage easement, with the following facilities:

6.5-foot-long Type A drop inlet #1 at Maple Court
233 LF of 18-inch RCP from DI#1 to DI#2
2-foot-long Type A drop inlet #2 at Banyon Court
239 LF of 18-inch RCP from DI#2 to DI#3
4.5-foot-long Type A drop inlet #3 at Cherry Blossom Drive
135 LF of 21-inch RCP from DI#3 to Sloan Channel
Flared end section and 10-foot-wide x 10-foot-long rip-rap pad, 1.5 feet thick of d_{50} = 0.75 or 25 lb. stone

f. 8-foot-wide valley gutter located at the project entrance and the west side of Maple Court at Mulberry Court, the west side of Cherry Blossom Drive at Apple Blossom Drive, and the east side of Maple Court at Apple Blossom Drive

3. A bond estimate must be submitted to Clark County Public Works for the stormwater management facilities noted in 2 above;

4. The minimum finish floor elevations for the proposed structures with the designated base flood elevations (BFE's) shall be constructed as shown on the above-referenced grading plan;

5. As a condition of approval, Clark County Public Works Design Division must concur with the proposed connection to the Sloan Channel;

6. The subject site is located within Zone A, as shown on FIRM Community-Panel Number 320003 1250B, revised September 29, 1989. Zone A is a special flood hazard area determined to be within the 100-year flood plain. No base flood elevations have been determined by FEMA;

7. Clark County Regional Flood Control District concurrence is required since the site is located within Flood Zone A and adjacent to regional facility. As a condition of final approval, the applicant must submit a copy of the drainage study and any addenda to the Clark County Regional Flood Control District. The final map will not be approved by the Board of County Commissioners until concurrence is obtained from the Clark County Regional Flood Control District;

8. *Right-of-way dedication must be verified;*

9. Mylars of the grading plan must be submitted to the Clark County Plan Check department for approval signatures prior to map recordation;

10. At the request of Clark County Public Works, we have reviewed the Grading plans in reference to section 34.030, Uniform Regulations for the Control of Drainage, Nov 12, 1990 for compliance to permitting requirements. **As a condition of final approval the grading plans submitted for this project require the following modifications to meet the minimum standards outlined in the above regulation.**

    - Revise the drainage easement where the box culvert is located to be a public underground drainage easement

    - Rename roads in storm drain profile

No liability is assumed by the County for information, data, and conclusions of the consulting engineer.

Yours truly,

Robert Thompson, P.E.
Civil Engineer III

WILLDAN ASSOCIATES ❑ ENGINEERS & PLANNERS

Professional Consulting Services Since 1964

MEMORANDUM

TO: Ralph M. Gabriel, P.E.
Isabel Pennington

FROM: Stephen L. Weatherman, P.E.

OFFICE: Las Vegas

DATE: November 30, 1994

SUBJECT: Willdan/Clark County Public Works Plan Review Contract
Technical Drainage Study for Cibola **(1530)**
Study Dated: November 19, 1994
Location: Southwest corner of Stewart Avenue and Sloan Channel
(Sec. 33, T. 20 S., R. 62 E.)
H.T.E. 94-25236
Prepared by Ray Novatney

We have completed our initial review of the above-referenced **Technical Drainage Study**, and have the following comments:

1. The design of the proposed storm drain on the south side of Stewart Avenue must be revised. The purpose of the storm drain is to collect flows within Stewart Avenue, but the proposed pipe is located outside of the right-of-way within a 10-foot-wide easement behind a block wall. The access and maintenance of the pipe would require access to the backyard of 14 lots. The pipe must be relocated into the Stewart Avenue right-of-way. The present design includes Y connections from the proposed drop inlets to the mainline pipe which does not meet current criteria. The storm drain connections must be with manholes. Alternately, the storm drain pipe may be run from drop inlet to drop inlet. Appropriate plan and profile must be provided for the storm drain design;

2. The submitted calculations and grading plan indicates the BFE's are above the channel bank. The finished floors are above the BFE's and apparently a retaining wall is to be placed on the Sloan Channel property line. This wall must be designed as a flood wall to include appropriate cutoff walls to prevent undercutting by the Sloan Channel. Appropriate calculations and designs are required;

3. The Sloan Channel is currently under design and the applicant must coordinate all improvements with the Clark County Public Works Design section;

2325-A RENAISSANCE DRIVE • LAS VEGAS, NEVADA 89119 • (702) 795-7870 • FAX (702) 795-3696

4. The current scale of 1-inch = 60 feet may not be legible when the required tc, road centerline elevations, and finished contours are added. If the plan cannot be legible to microfilm, the scale must be changed;

5. The grading plan will be reviewed by the building department to ensure compliance with the handicap access requirements (see attached letter). Revisions to the grading plan may be required if the site accessibility design does not comply with the requirements set forth in the Accessibility Chapter of the Clark County Building Code;

6. Clark County Regional Flood Control District concurrence is required since the site is located within Flood Zone A and adjacent to a regional facility. As a condition of final approval, the applicant must submit a copy of the drainage study and any addenda to the Clark County Regional Flood Control District. The final map will not be approved by the Board of County Commissioners until concurrence is obtained from the Clark County Regional Flood Control District;

7. At the request of Clark County Public Works, grading plans for the proposed development have been reviewed for compliance to permitting requirements according to Section 34.030 of the "Uniform Regulations for the Control of Drainage," revised November 12, 1990. **The plans submitted do not meet the minimum requirements and must be revised prior to Drainage Study approval, to address the following:**

   a. Existing pavement, show sawcut and replace areas, pavement transitions

   b. Typical road sections

   c. Profile, HGL for proposed storm drains

   d. Proposed contours

   e. Crown elevations at lot lines and extension of lot lines

   f. Details at property lines, fences, and berms

   g. Details of flood walls and retaining walls

   h. Detail of proposed or future block wall opening with flowline elevation

The grading plan has been red-lined and is being returned to the engineer. The red-lined grading plan must be resubmitted with the revised drawings. Failure to resubmit the red-lined grading plan will prevent further review of the project.

All addenda must be submitted directly to Clark County. Any drainage studies or addenda submitted directly to Willdan will be returned to Clark County for the necessary log- in procedures.

The items listed herein must be thoroughly addressed and submitted for review prior to acceptance of this study.

A study review workshop with Willdan Associates may be scheduled if there are questions concerning the above listed comments.

MEMORANDUM

TO: Ralph M. Gabriel, P.E.
Isabel Pennington

FROM: Stephen L. Weatherman, P.E.

OFFICE: Las Vegas

DATE: January 11, 1995

SUBJECT: Willdan/Clark County Public Works Plan Review Contract
Technical Drainage Study for Cibola **(1530)**
Study Dated: November 19, 1994
First Addendum Dated: December 30, 1994
Location: Southwest corner of Stewart Avenue and Sloan Channel
(Sec. 33, T. 20 S., R. 62 E.)
H.T.E.# 94-25236
Prepared by Ray Novatney

We have completed our second review of the above-referenced **Technical Drainage Study**, and have the following comments:

1. A *fax memo which listed the following items had been requested by the project* engineer initially. Due to a schedule change, a response to the fax memo within five days is not possible and the engineer has requested a standard review memo. The drainage facility plans were provided to the engineer with the fax memo and are not included with this review;

2. The width of the drainage channel on the south side of Stewart Avenue is shown as 8 feet wide. The minimum width required to allow maintenance is 10 feet. The channel must be ~~widened to 10 feet;~~ 8' OK RJ.

3. *The public drainage easement cannot include the project side channel wall.* The public drainage easement must be revised to begin on the north side of the south wall;

4. A traffic barrier is required on the north side of the channel. The proposed wall must be designed to resist traffic impacts or a guiderail may be used. The spillway entrance also requires a traffic barrier. This can be a wall with openings or a guiderail. This barrier must extend from the gate to the beginning of the proposed wall. The 12-foot-wide chainlink gate is acceptable;

2349 RENAISSANCE DRIVE • LAS VEGAS, NEVADA 89119 • (702) 795-7870 • FAX (702) 795-3696

5. At the request of Clark County Public Works, grading plans for the proposed development have been reviewed for compliance to permitting requirements according to Section 34.030 of the "Uniform Regulations for the Control of Drainage," revised November 12, 1990. **The plans submitted do not meet the minimum requirements and must be revised prior to Drainage Study approval, to address the following:**

   a. Revise channel width

   b. Revise easement to begin on the north side of the south channel wall

   c. Revise chainlink fence to be traffic barrier

   d. Revise north channel wall to be traffic barrier

The grading plan has been red-lined and is being returned to the engineer. The red-lined grading plan must be resubmitted with the revised drawings. Failure to resubmit the red-lined grading plan will prevent further review of the project.

All addenda must be submitted directly to Clark County. Any drainage studies or addenda submitted directly to Willdan will be returned to Clark County for the necessary log- in procedures.

The items listed herein must be thoroughly addressed and submitted for review prior to acceptance of this study.

A study review workshop with Willdan Associates may be scheduled if there are questions concerning the above listed comments.

FAX MEMORANDUM

TO: Ray Navatney, P.E.

FROM: Stephen L. Weatherman, P.E.

DATE: January 5, 1995

SUBJECT: **Technical Drainage Study** for Cibola (1530)
H.T.E. 94-25236

This memo is being faxed in lieu of a typical mailed memorandum in order to expedite the review process. The following items are required in order to produce an approval memorandum for the above referenced **Technical Drainage Study:**

Drainage Study

1.) The width of the drainage channel on the south side of Stewart Avenue is shown as 8-foot-wide. The minimum width required to allow maintenance is 10 feet. The channel must be widened to 10 feet; 2). The public drainage easement cannot include the project side channel wall. The public drainage easement must be revised to begin on the north side of the south wall; 3.) A traffic barrier is required on the north side of the channel. The proposed wall can be designed to resist traffic impacts or a guiderail may be used. The spillway entrance also requires a traffic barrier. This can be a wall with openings or a guiderail. This barrier must extend from the gate to the beginning of the proposed wall. The 12-foot-wide chainlink gate is acceptable;

Grading Plan

1. Revise channel width; 2.) Revise easement to begin on the north side of the south channel wall; 3.) Revise chainlink fence to be traffic barrier; 4.) Revise north channel wall to be traffic barrier;

The supplemental information must be submitted directly to Willdan Associates.

The items listed herein must be thoroughly addressed and submitted for review within 5 days of the above date.

cc: Phu Simpson, CCPW

WILLDAN ASSOCIATES ☐ ENGINEERS & PLANNERS

Professional Consulting Services Since 1964

MEMORANDUM

TO: Ralph M. Gabriel, P.E.
Isabel Pennington

FROM: Stephen L. Weatherman, P.E.

OFFICE: Las Vegas

DATE: January 23, 1995

SUBJECT: Willdan/Clark County Public Works Plan Review Contract
Technical Drainage Study for Cibola **(1530)**
Study Dated: November 19, 1994
First Addendum Dated: December 30, 1994
Second Addendum Dated: January 15, 1995
Located: Southwest corner of Stewart Avenue and Sloan Channel
(Sec. 33, T. 20 S., R. 62 E.)
H.T.E.# 94-25236
Prepared by Ray Novatney

We have completed our third review of the above-referenced **Technical Drainage Study**, and have the following comments:

1. The following comments refer to the structural calculations for the traffic barrier wall:

   a. Calculation sheet S-1 for the horizonal masonry beam spreading the impact load utilizes an allowable bending stress of 500 PSI. Per UBC 2406(c), this value must be reduced by one-half if special inspection is not provided. If full stress is to be used, the drawings must be revised to note that special inspection is required. Ref. UBC/UAC 302(c)1;

   b. Calculation sheet S-3 shows the value of 2kj is determined by using n=40. The value of n is based on the definition given in UBC 2401 using Em=750 x f'm from UBC 2406(f)B. The value of Em is not reduced for half-stress purposes. This resulted in a value of n=26. A revaluation of the masonry stress shows it exceeds the allowable value of 250 PSI;

   The structural calculations and structural details must be revised to incorporate these comments.

2. The NDOT Details of the Steel Post Metal Beam Guardrail are not County standards and must be shown on the plans;

2349 RENAISSANCE DRIVE • LAS VEGAS, NEVADA 89119 • (702) 795-7870 • FAX (702) 795-3696

All addenda must be submitted directly to Clark County. Any drainage studies or addenda submitted directly to Willdan will be returned to Clark County for the necessary log- in procedures.

The items listed herein must be thoroughly addressed and submitted for review prior to acceptance of this study.

A study review workshop with Willdan Associates may be scheduled if there are questions concerning the above listed comments.

CONCURRENCE BY CLARK COUNTY PUBLIC WORKS:

Signature _____ Date 1/24/95

COMMENTS: Item 1. Portable precast concrete barrier rail [NDOT's standard dwg. R-8.3.3. (502)] may be used in lieu of the structurally designed traffic barrier wall. In either case, chain link fence is to be installed on top of the conc. barrier for a total wall height of 6'.

* There is a 2' drop between the channel invert and the ~~box~~ flow line elev. of the box culvert under Magenta Wy. While the channel slope is only 0.16% the engineer is requested to look into increasing the channel slope to reduce future maintenance work on the channel

PURPOSE OF STUDY

THE SITE IS BORDERED ON THE EAST BY THE SLOAN FLOOD CONTROL CHANNEL AND ON THE NORTH BY STEWART STREET WHICH WOULD RECEIVE CONSIDERABLE RUNOFF FROM THE NORTH DURING A 100-YEAR STORM. THIS STUDY IS TO EVALUATE THE IMPACT THAT A 100-YEAR STORM RUNOFF WILL HAVE ON THE SITE.

THE SITE IS LOCATED IN ZONE "A", AN AREA DETERMINED TO BE WITHIN A 100-YEAR FLOOD PLAIN WITH NO BASE FLOOD ELEVATIONS DETERMINED, ACCORDING TO "FIRM" PANEL 320003-1250-B. A COPY OF THE PERTINENT AREA OF THIS PANEL IS SHOWN ON PAGE A-2.

SITE CHARACTERISTICS

THE SITE IS LOCATED IN THE NORTHEAST QUARTER OF THE SOUTHEAST QUARTER OF SECTION 33, T20S, R62E, MDM IN CLARK COUNTY. IT IS BORDERED ON THE NORTH BY STEWART STREET AND ON THE EAST BY THE SLOAN CHANNEL. IT IS ABUTTED ON THE WEST AND SOUTH SIDES BY EXISTING RESIDENTIAL DEVELOPMENT. THE SITE CONTAINS 12.7 ACRES AND INCLUDES ASSESSORS PARCEL NUMBERS 25-04-03, 25-04-04, AND 25-04-05. THE ASSESSORS PARCEL MAP IS SHOWN ON PAGE A-1.

THERE IS AN EXISTING WASH TRAVERSING DIAGONALLY ACROSS THE SITE FROM ITS NORTHWEST TO SOUTHEAST CORNERS. THE WASH DOES NOT APPEAR TO BE IN ITS NATURAL POSITION, BUT HAS MIGRATED EASTERLY DUE TO DEVELOPMENT ON THE NORTH, EAST, AND SOUTH SIDES OF THE SITE. THIS WASH CARRIES A SUBSTANTIAL AMOUNT OF RUNOFF FROM BATTLE MOUNTAIN DRIVE AT ITS INTERSECTION WITH STEWART TOGETHER WITH FLOW FROM THE WEST ON STEWART. BATTLE MOUNTAIN INTERSECTS STEWART AT ABOUT THE WEST QUARTER POINT OF THE SITE. THE ORIGIONAL AND PRESENT LOCATION OF THE WASH IS SHOWN ON EXHIBIT "A" IN THIS REPORT. OTHER THAN THE WASH, ONSITE GRADES ARE ON A RELATIVELY LEVEL PLANE.

THE SITE IS PROPOSED TO BE A RESIDENTIAL SUBDIVISION WITH ONSITE PRIVATE STREETS AND WILL BE ACCESSED FROM STEWART STREET.

SLOAN CHANNEL

A PREDESIGN DRAINAGE ANALYSIS AND IMPROVEMENT PLANS FOR THE SLOAN CHANNEL FROM OWENS AVENUE TO LAS VEGAS WASH HAVE BEEN COMPLETED BY G.C.WALLACE, INC. AND APPROVED BY CLARK COUNTY. UPON COMPLETION OF THE CHANNEL IMPROVEMENTS, THE 100-YEAR FLOW IN THE CHANNEL WILL BE 3300 CFS AT STEWART.

PRESENTLY, THE "FIS" RATES CHANNEL FLOW FOR A 100-YEAR STORM FROM 5200 CFS AT OWENS AVENUE TO 6000 CFS AT VEGAS VALLEY DRIVE. A LINEAR ADJUSTMENT WAS MADE ON PAGE B-3 TO OBTAIN A CHANNEL FLOW OF 5500 CFS AT STEWART.

A WATER SURFACE PROFILE FOR THE CHANNEL WAS DONE ON PAGES B-1 TO B-23 FOR THE 5500 CFS AND 3300 CFS FLOWS WITH SECTION 8 BEING THE SOUTH RIGHT OF WAY OF STEWART AND SECTION 2 BEING NEAR THE SOUTH-EAST CORNER OF THE SITE. STATION LOCATIONS ARE SHOWN ON PAGE B-1 AND BASE FLOOD ELEVATIONS ARE AS FOLLOWS FOR THE TWO FLOWS:

SECNO	5500 CFS	3300 CFS
1	1738.2	1735.8
2	1738.7	1737.1
3	1738.8	1737.0
4	1740.1	1738.3
5	1740.5	1738.5
6	1740.5	1738.3
7	1741.9	1739.8
8	1741.9	1739.8
9	1741.8	1739.8
10	1741.1	1739.2

GRADING PLAN ELEVATIONS WILL BE PRESENTLY BASED ON THE BFE'S FOR THE 5500 CFS. HOWEVER, IF CHANNEL CONSTRUCTION IS COMPLETED NORTH OF STEWART PRIOR TO THE DEVELOPMENT OF THE SITE, GRADES ALONG THE CHANNEL MAY BE LOWERED TO CONFORM TO THE BFE'S FOR 3300 CFS.

OFFSITE DRAINAGE AREAS

THE OFFSITE DRAINAGE AREAS, DA 1, DA 2, DA 3, DA 4, AND DA 5 ARE SHOWN ON PAGE C-1. CALCULATIONS FOR THE PEAK RAINFALL RUNOFF FROM A 100-YEAR STORM ARE MADE AN PAGES C-2 THROUGH C-16. SPLIT FLOWS FOR THE INTERSECTIONS OF STEWART/CHRISTY, STEWART/UNGER, STEWART/LINN, AND BATTLE MOUNTAIN/LINN TOGETHER WITH THE FLOOD ROUTING OF DA 3/DA 4 AND DA 3/DA 4/DA 5 ARE MADE ON PAGES C-17 TO C-55 WITH A FLOW SUMMARY DEPICTED ON PAGE C56.

THE PARAMETERS OF DA 1 AND DA 2 ARE AS FOLLOWS:

DA	AREA	CN	Q	T	PEAK RUNOFF
1	4.8 AC	72	0.81"	0.27 HR	4 CFS
2	70.9 AC	72	0.81"	0.50 HR	41 CFS

DA 1 IS CONTAINED BY AN EXISTING STORM DRAIN SYSTEM IN LAKE MEAD DRAINING TO THE SLOAN CHANNEL AND DOES NOT IMPACT THE SITE. DA 2 IS PARTIALLY CONTAINED BY AN EXISTING STORM DRAIN SYSTEM IN LAKE MEAD AND CONTRIBUTES AN OVERFLOW OF 9 CFS TO DA 3.

THE PARAMETERS OF DA 3, DA 4, AND DA 5 ARE AS FOLLOWS:

DA	BA	LS	PB	UD	PEAK RUNOFF
2	1.27 MI^2	72	2.74"	0.94 HR	326 CFS
4	0.54 MI^2	74	2.80"	0.73 HR	193 CFS
5	0.09 MI^2	75	2.86"	0.26 HR	67 CFS

5 0.09 MI² 75 2.86" 0.26 HR 67 CFS

THE SUM OF THE DA 3, DA 4, AND DA 5 RUNOFF OF 595 CFS (UNROUTED) COMPARES FAVORABLY TO THE G.C.WALLACE PREDESIGN ANALYSIS FOR THE SLOAN CHANNEL OF 579 CFS FLOWING IN STEWART AT THE SLOAN CHANNEL FROM A 100-YEAR STORM. IN THE WALLACE REPORT, THE ENTIRE FLOW WAS ASSUMED TO REMAIN IN STEWART. IN THIS REPORT, SPLIT FLOWS DRAINING SOUTH ON STREETS INTERSECTING STEWART WAS CONSIDERED. THESE FLOW LOSSES ARE AS FOLLOWS:

SOUTH ON CHRISTY = 173 CFS
SOUTH ON UNGER = 50 CFS
SOUTH ON LINN = 65 CFS

FLOWS FROM DA 3, DA 4, AND DA 5 WERE ROUTED BY THE MUSKINGUM METHOD, SUBTRACTING THE FLOWS LOST TO INTERSECTING STREETS, TO PRODUCE THE FOLLOWING FLOWS IN STEWART ADJACENT TO THE SITE:

WEST OF BATTLE MOUNTAIN = 80 CFS
AT BATTLE MOUNTAIN = 217 CFS
AT SEARCHLIGHT = 242 CFS

A STORM DRAIN SYSTEM, SHOWN ON PAGE D-1, WAS DESIGNED ON PAGES D-2 THROUGH D-12 TO CONVEY THE ABOVE FLOWS TO THE SLOAN CHANNEL. WITH CONSIDERATION TO THE EXISTING STORM DRAIN SYSTEM AND GUTTER FLOW ON THE NORTH SIDE OF STEWART AND EXISTING DRAIN INLETS ON THE SOUTH SIDE OF STEWART AT THE SLOAN CHANNEL, THE PROPOSED SYSTEM WILL ELIMINATE RUNOFF FROM THE SOUTH SIDE OF STEWART.

GUTTER DEPTHS AND DEPTH/VELOCITY RATIOS FROM A 100-YEAR STORM IN THE SOUTH SIDE OF STEWART ARE AS FOLLOWS:

	DEPTH	d/v
WEST OF THE SITE	1.1	2.7
WEST OF BATTLE MOUNTAIN	0.9	1.7
EAST OF BATTLE MOUNTAIN	0.8	1.9

ONSITE DRAINAGE

THE ONSITE DRAINAGE AREAS ARE SHOWN ON PAGE E-1 WITH PEAK RUNOFF VALUES FOR 10-, 25-, AND 100-YEAR STORMS DETERMINED ON PAGES E-2 THROUGH E-6. GUTTER FLOW DEPTH ARE DETERMINED ON PAGES E-7 TO E-24 AND THE ONSITE PRIVATE STORM DRAIN IS OUTLINED ON E-25.

THE ONSITE STREET FLOWS AND GUTTER FLOW DEPTHS ARE AS FOLLOWS:

DA	Q-10	Q-25	Q-100
01	2.2 CFS	3.6 CFS	5.8 CFS
02	0.7 CFS	1.1 CFS	1.8 CFS
03	1.5 CFS	2.4 CFS	3.9 CFS

DA	Q-10	Q-25	Q-100
01	0.33'	0.37'	0.42'
02	0.25'	0.28'	0.31'
03	0.30'	0.34'	0.38'

ALL GUTTER DEPTH FLOWS ARE BELOW TOP OF CURB ELEVATION.

THE ONSITE PRIVATE STORM DRAIN ALONG THE SOUTH SIDE OF THE SITE IS AS FOLLOWS:

DA	SIZE TYPE "A" DI	SIZE & GRADE OF DRAIN
01	6.5' OPENING	18" RCP @ 0.3%
02	2.0' OPENING	18" RCP @ 0.5%
03	4.5' OPENING	21" RCP @ 0.5%

FUTURE CCRFCD FACILITIES

FUTURE CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT PROPOSED IMPROVEMENTS IN THE VICINITY OF THE SITE ARE SHOWN ON PAGE F-15. THEY ARE THE IMPROVEMENT OF THE SLOAN CHANNEL AND CONSTRUCTION OF THE RANGE WASH DETENTION BASIN REDUCING THE FLOW IN THE CHANNEL ADJACENT TO THE SITE TO 2030 CFS.

SOIL PERMIABILITY

THE HYDROLOGIC SOIL GROUP (HSG) USED IN THE RAINFALL RUNOFF CALCULATIONS WAS TAKEN FROM CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT VOLUME 2 UPDATE, AUGUST 1991. THE AREA OF CONCERN IS SHOWN ON PAGE H-15.

PRECIPITATION

PRECIPITATION AMOUNTS USED IN THE RAINFALL RUNOFF CALCULATIONS ARE VALUES TAKEN FROM NOAA ATLAS II (NEVADA) FOR A 6-HOUR OR 24-HOUR DURATION STORM.

CALCULATION METHOD

THE METHOD USED TO DETERMINE THE PEAK RAINFALL RUNOFF VALUES FOR SMALL DRAINAGE AREAS IS AS OUTLINED IN USDA, SOIL CONSEVATION SERVICE TECHNICAL RELEASE 55 DATED JUNE 1986: "URBAN HYDROLOGY FOR SMALL WATERSHEDS" USING A TYPE II RAINFALL DISTRIBUTION.

THE METHOD USED TO DETERMINE THE PEAK RAINFALL RUNOFF VALUES FOR LARGE DRAINAGE AREAS IS THE US ARMY CORPS OF ENGINEERS HEC-1 COMPUTER PROGRAM UPDATED AUGUST 1988.

THE METHOD USED TO DETERMINE THE WATER SURFACE PROFILE, MUSKINGUM ROUTING, AND SPLIT FLOWWS IS THE US ARMY CORPS OF ENGINEERS HEC-2 COMPUTER PROGRAM UPDATED SEPTEMBER 1989.

SPECIAL FLOOD HAZARD AREAS INUNDATED BY 100-YEAR FLOOD

- **ZONE A** — No base flood elevations determined.
- **ZONE AE** — Base flood elevations determined.
- **ZONE AH** — Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
- **ZONE AO** — Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
- **ZONE A99** — To be protected from 100-year flood by Federal flood protection system under construction; no base flood elevations determined.
- **ZONE V** — Coastal flood with velocity hazard (wave action); no base flood elevations determined.
- **ZONE VE** — Coastal flood with velocity hazard (wave action); base flood elevations determined.

FLOODWAY AREAS IN ZONE AE

OTHER FLOOD AREAS

- **ZONE X** — Areas of 500-year flood; areas of 100-year flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 100-year flood.

OTHER AREAS

- **ZONE X** — Areas determined to be outside 500-year flood plain.
- **ZONE D** — Areas in which flood hazards are undetermined.

- Flood Boundary
- Floodway Boundary
- Zone D Boundary
- Boundary Dividing Special Flood Hazard Zones
- 513 — Base Flood Elevation Line; Elevation in Feet*
- D — D — Cross Section Line
- (EL 987) — Base Flood Elevation in Feet Where Uniform Within Zone*
- RM7x — Elevation Reference Mark

DA 3, DA 4, DA 5 SUMMARY

DA 3 = 335 CFS
DA 4 = 193 CFS
DA 5 = 67 CFS

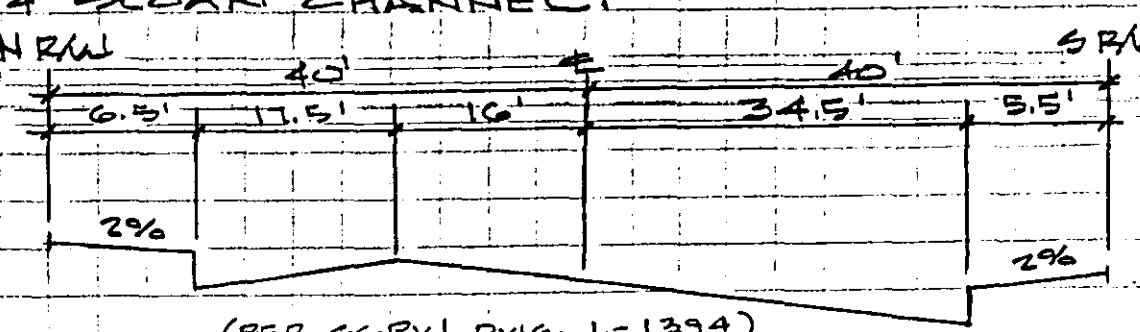
ΣQ_{100} = 595 CFS (UNROUTED)

THIS FAVORABLY CORRESPONDS TO G C WALLACE "FINAL PREDESIGN MEMORANDUM - SLOAN CHANNEL - OWENS AVENUE TO LAS VEGAS WASH" 7/9/93; Q_{100} = 579 CFS IN STEWART AT SLOAN.

IN THE WALLACE REPORT, ALL FLOW WAS ASSUMED TO REMAIN IN STEWART.

IN THIS REPORT, SPLIT FLOWS FOR INTERSECTING STREETS FLOWING SOUTH FROM STEWART WILL BE ANALYSED TO DETERMINE HOW MUCH FLOW IS LOST FROM STEWART WEST OF THE SLOAN CHANNEL.

AN CROWN OFFSET TO THE NORTH SIDE OF STEWART EXISTS BETWEEN CHRISTY & SLOAN CHANNEL.



(PER CCPW DWG. L-1394)

SPLIT FLOW - STEWART TO CHRISTY & UNGER

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1D8, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

Worksheet 4: Graphical Peak Discharge method

Project: EIBOLA By: N Date: _____

Location: EDA 10 Checked: _____ Date: _____

Circle one: Present | Developed A = 6.10 AC

1. Data:

Drainage area ..... A_m = 0.00094 mi^2 (acres/640)

Runoff curve number .... CN = 75 (From worksheet 2)

Time of concentration .. T_c = 0.27 hr (From worksheet 3)

Rainfall distribution type = II (I, IA, II, III)

Pond and swamp areas spread throughout watershed ..... = 0 percent of A_m (____ acres or mi^2 covered)

			Storm #1	Storm #2	Storm #3
2.	Frequency	yr	10	25	100
3.	Rainfall, P (24-hour)	in	2.0	2.4	3.0
4.	Initial abstraction, I_a ..... (Use CN with table 4-1.)	in	0.667	0.667	0.667
5.	Compute I_a/P		0.33	0.28	0.22
6.	Unit peak discharge, q_u ..... (Use T_c and I_a/P with exhibit 4-II)	csm/in	615	630	645
7.	Runoff, Q ..... (From worksheet 2).	in	0.38	0.60	0.96
8.	Pond and swamp adjustment factor, F_p .... (Use percent pond and swamp area with table 4-2. Factor is 1.0 for zero percent pond and swamp area.)		1.0	1.0	1.0
9.	Peak discharge, q_p ..... (Where $q_p = q_u A_m Q F_p$)	cfs	2.2	3.6	5.8

Worksheet 4: Graphical Peak Discharge method

Project: EIBOLA By: N Date: _____

Location: DA 02 Checked: _____ Date: _____

Circle one: Present | Developed A = 1.6 AC

1. Data:

   Drainage area ..... A_m = 0.0025 mi^2 (acres/640)

   Runoff curve number .... CN = 75 (From worksheet 2)

   Time of concentration .. T_c = 0.18 hr (From worksheet 3)

   Rainfall distribution type = II (I, IA, II, III)

   Pond and swamp areas spread throughout watershed ..... = 0 percent of A_m (____ acres or mi^2 covered)

			Storm #1	Storm #2	Storm #3
2.	Frequency	yr	10	25	100
3.	Rainfall, P (24-hour)	in	2.0	2.4	3.0
4.	Initial abstraction, I_a ..... (Use CN with table 4-1.)	in	0.6667	0.6667	0.6667
5.	Compute I_a/P		0.33	0.28	0.22
6.	Unit peak discharge, q_u ..... (Use T_c and I_a/P with exhibit 4-II)	csm/in	700	730	760
7.	Runoff, Q ..... (From worksheet 2).	in	0.38	0.60	0.96
8.	Pond and swamp adjustment factor, F_p .... (Use percent pond and swamp area with table 4-2. Factor is 1.0 for zero percent pond and swamp area.)		1.0	1.0	1.0
9.	Peak discharge, q_p ..... (where $q_p = q_u A_m Q F_p$)	cfs	0.7	1.1	1.8

Worksheet 4: Graphical Peak Discharge method

Project: CIRCLA By: N Date: _____

Location: DA-03 Checked: _____ Date: _____

Circle one: Present | Developed | A = 3.9 AC

1. Data:

Drainage area ..... A_m = 0.00061 mi^2 (acres/640)

Runoff curve number .... CN = 75 (From worksheet 2)

Time of concentration .. T_c = 0.25 hr (From worksheet 3)

Rainfall distribution type = II (I, IA, II, III)

Pond and swamp areas spread throughout watershed ..... = 0 percent of A_m (____ acres or mi^2 covered)

			Storm #1	Storm #2	Storm #3
2.	Frequency	yr	10	25	100
3.	Rainfall, P (24-hour)	in	2.0	2.4	3.0
4.	Initial abstraction, I_a ..... (Use CN with table 4-1.)	in	0.667	0.667	0.667
5.	Compute I_a/P		0.33	0.28	0.22
6.	Unit peak discharge, q_u ..... (Use T_c and I_a/P with exhibit 4-II)	csm/in	650	660	670
7.	Runoff, Q ..... (From worksheet 2).	in	0.38	0.60	0.96
8.	Pond and swamp adjustment factor, F_p .... (Use percent pond and swamp area with table 4-2. Factor is 1.0 for zero percent pond and swamp area.)		1.0	1.0	1.0
9.	Peak discharge, q_p ..... (where $q_p = q_u A_m Q F_p$)	cfs	1.5	2.4	3.9

RE: ADDENDUM TO DRAINAGE STUDY FOR CIBOLA
HTE 94-25236

SUBJECT: WILLDAN ASSOCIATES MEMORANDUM DATED 01/23/95.

A COPY OF THE MEMORANDUM IS ATTACHED AND THE ENGINEERS COMMENTS ARE AS FOLLOWS:

ITEM 1. A SPECIAL INSPECTION NOTE HAS BEEN ADDED TO THE GRADING PLAN FOR THE NORTH WALL OF THE DRAIN AND A CHAIN LINK FENCE IS ADDED TO THE TOP OF THIS WALL FOR A TOTAL HEIGHT OF 6 FEET. PAGE S-3 HAS BEEN REVISED.

ITEM 2. DETAILS HAVE BEEN ADDED TO SHEET 2 OF THE GRADING PLAN FOR THE GUARDRAIL (AND THE BOX CULVERT). IN REFERENCE TO A TELEPHONE CONVERSATION WITH ROBERT THOMPSON, PE, CCPW ON 01/31/95, IT WAS DETERMINED THAT SELF ADHESIVE COPIES OF NDOT STANDARDS WERE SUFFICIENT.

MEMORANDUM

TO: Ralph M. Gabriel, P.E.
Isabel Pennington

FROM: Stephen L. Weatherman, P.E.

OFFICE: Las Vegas

DATE: January 23, 1995

SUBJECT: Willdan/Clark County Public Works Plan Review Contract
Technical Drainage Study for Cibola (1530)
Study Dated: November 19, 1994
First Addendum Dated: December 30, 1994
Second Addendum Dated: January 15, 1995
Located: Southwest corner of Stewart Avenue and Sloan Channel
(Sec. 33, T. 20 S., R. 62 E.)
H.T.E.# 94-25236
Prepared by Ray Novatney

We have completed our third review of the above-referenced **Technical Drainage Study**, and have the following comments:

1. The following comments refer to the structural calculations for the traffic barrier wall:

   a. Calculation sheet S-1 for the horizonal masonry beam spreading the impact load utilizes an allowable bending stress of 500 PSI. Per UBC 2406(c), this value must be reduced by one-half if special inspection is not provided. If full stress is to be used, the drawings must be revised to note that special inspection is required. Ref. UBC/UAC 302(c)1;

   b. Calculation sheet S-3 shows the value of 2kj is determined by using n=40. The value of n is based on the definition given in UBC 2401 using Em=750 x f'm from UBC 2406(f)B. The value of Em is not reduced for half-stress purposes. This resulted in a value of n=26. A revaluation of the masonry stress shows it exceeds the allowable value of 250 PSI;

   The structural calculations and structural details must be revised to incorporate these comments.

2. The NDOT Details of the Steel Post Metal Beam Guardrail are not County standards and must be shown on the plans;
   SELF-ADHESIVE COPIES OF NDOT STDS. SUFFICIENT PER T.P. CONV. W/ ROBT. THOMPSON 1/31/95.

2349 RENAISSANCE DRIVE • LAS VEGAS, NEVADA 89119 • (702) 795-7870 • FAX (702) 795-3696

All addenda must be submitted directly to Clark County. Any drainage studies or addenda submitted directly to Willdan will be returned to Clark County for the necessary log- in procedures.

The items listed herein must be thoroughly addressed and submitted for review prior to acceptance of this study.

A study review workshop with Willdan Associates may be scheduled if there are questions concerning the above listed comments.

CONCURRENCE BY CLARK COUNTY PUBLIC WORKS:

John Hannon — 1/24/95

Signature — Date

COMMENTS: Item 1. Portable precast concrete barrier rail [NDOT's standard dwg. R-8.3.3. (502)] may be used in lieu of the structurally designed traffic barrier wall. In either case, chain link fence is to be installed on top of the conc barrier for a total wall height of 6'.

* There is a 2' drop between the channel invert and the ~~box~~ flow line elev. of the box culvert under Magenta Wy. While the channel slope is only 0.16% the engineer is requested to look into increasing the channel slope to reduce future maintenance work on the channe

PS 1-24-95

CHANNEL GRADE IS SET AT STREET GRADE FOR A UNIFORM WALL HEIGHT TO ENHANCE ITS APPEARANCE - WILL INCREASE LENGTH OF DROP AREA

cc: John Sara

RE: ADDENDUM TO DRAINAGE STUDY FOR CIBOLA
HTE 94-25236

SUBJECT: WILLDAN ASSOCIATES MEMORANDUM DATED 01/11/95.

A COPY OF THE MEMORANDUM IS ATTACHED AND THE ENGINEERS COMMENTS ARE AS FOLLOWS:

ITEM 1. BOTH SHEETS OF THE GRADING PLAN CHECK PRINTS ARE BEING RETURNED,

ITEM 2. AN 8-FOOT WIDE CHANNEL IS SUFFICIENT FOLLOWING A MEETING ON THIS PROJECT BETWEEN THE OWNER AND ROBERT THOMPSON, PE, CCPW ON THE 11th OF JANUARY, 1995.

ITEM 3. THE PUBLIC DRAINAGE EASEMENT HAS BEEN ADJUSTED.

ITEM 4. THE WALL HAS BEEN DESIGNED TO RESIST TRAFFIC IMPACT.

ITEM 5. GRADING PLAN REVISIONS HAVE BEEN MADE.

END OF COMMENTS

REGISTERED PROFESSIONAL ENGINEER STATE OF NEVADA
RAY NOVATNEY
CIVIL
No. 4028

01/15/95

JAN 1 1995

5. At the request of Clark County Public Works, grading plans for the proposed development have been reviewed for compliance to permitting requirements according to Section 34.030 of the "Uniform Regulations for the Control of Drainage," revised November 12, 1990. **The plans submitted do not meet the minimum requirements and must be revised prior to Drainage Study approval, to address the following:**

8' OK PER ITEM #2

a. Revise channel width

b. Revise easement to begin on the north side of the south channel wall

c. Revise chainlink fence to be traffic barrier

d. Revise north channel wall to be traffic barrier

The grading plan has been red-lined and is being returned to the engineer. The red-lined grading plan must be resubmitted with the revised drawings. Failure to resubmit the red-lined grading plan will prevent further review of the project.

All addenda must be submitted directly to Clark County. Any drainage studies or addenda submitted directly to Willdan will be returned to Clark County for the necessary log- in procedures.

The items listed herein must be thoroughly addressed and submitted for review prior to acceptance of this study.

A study review workshop with Willdan Associates may be scheduled if there are questions concerning the above listed comments.

RE: ADDENDUM TO DRAINAGE STUDY FOR CIBOLA
HTE 94-25236

SUBJECT: WILLDAN ASSOCIATES MEMORANDUM DATED 11/30/94.

A COPY OF THE MEMORANDUM IS ATTACHED AND THE ENGINEERS COMMENTS ARE AS FOLLOWS:

ITEM 1. THE STEWART AVENUE STORM DRAIN HAS BEEN REDESIGNED. HYDRAULIC AND STRUCTURAL CALCULATIONS, AND REVISED GRADING PLAN ARE HEREIN INCLUDED.

ITEM 2. WALL SECTIONS HAVE BEEN INCLUDED ON THE GRADING PLAN. REFERING TO THE SLOAN CHANNEL HEC 11 WATER SURFACE PROFILE, RIGHT (SITE SIDE) OVERBANK VELOCITIES VARY FROM 0 TO 3.4 FPS WHICH IS LOWER THAN THE ALLOWABLE VELOCITY OF 3.75 FPS FOR ONSITE SOILS OF SILT-LOAM-COBBLE.

ITEM 3. A COPY OF THE DRAINAGE STUDY AND GRADING PLAN WERE SUBMITTED TO CCPW DESIGN SECTION ON 12/08/94. A COPY OF THIS ADDENDUM WILL BE SUBMITTED TO THEM.

ITEM 4. REQUIRED ADDITIONAL INFORMATION HAS BEEN ADDED TO THE PLAN AND IT IS LEGIBLE.

ITEM 5. HANDICAP FACILITIES ARE SHOWN ON THE GRADING PLAN.

ITEM 6. A COPY OF THE DRAINAGE STUDY AND GRADING PLAN WERE SUBMITTED TO CCRFCD AND A COPY OF THIS ADDENDUM WILL BE SUBMITTED TO THEM.

ITEM 7. THE NOTED ITEMS, WHEN APPLICABLE, HAVE BEEN INCORPORATED ON THE GRADING PLAN.

END OF COMMENTS

MEMORANDUM

TO: Ralph M. Gabriel, P.E.
Isabel Pennington

FROM: Stephen L. Weatherman, P.E.

OFFICE: Las Vegas

DATE: November 30, 1994

SUBJECT: Willdan/Clark County Public Works Plan Review Contract
Technical Drainage Study for Cibola **(1530)**
Study Dated: November 19, 1994
Location: Southwest corner of Stewart Avenue and Sloan Channel (Sec. 33, T. 20 S., R. 62 E.)
H.T.E. 94-25236
Prepared by Ray Novatney

We have completed our initial review of the above-referenced **Technical Drainage Study**, and have the following comments:

X 1. The design of the proposed storm drain on the south side of Stewart Avenue must be revised. The purpose of the storm drain is to collect flows within Stewart Avenue, but the proposed pipe is located outside of the right-of-way within a 10-foot-wide easement behind a block wall. The access and maintenance of the pipe would require access to the backyard of 14 lots. The pipe must be relocated into the Stewart Avenue right-of-way. The present design includes Y connections from the proposed drop inlets to the mainline pipe which does not meet current criteria. The storm drain connections must be with manholes. Alternately, the storm drain pipe may be run from drop inlet to drop inlet. Appropriate plan and profile must be provided for the storm drain design;

REDESIGNED, THE FIFE IS 7' WIDE - CAN'T RUN FROM D.I. TO D.I. 4 CAN'T MAINTAIN 10' CLEAR FROM EX. 42" WATER, ALSO NO COVER ON FIFE IN R/W.

✓ 2. The submitted calculations and grading plan indicates the BFE's are above the channel bank. The finished floors are above the BFE's and apparently a retaining wall is to be placed on the Sloan Channel property line. This wall must be designed as a flood wall to include appropriate cutoff walls to prevent undercutting by the Sloan Channel. Appropriate calculations and designs are required; "GLENDALE" SILT-LOAM-COBBLES GOOD FOR 2.75 FPS

2	4.6
3	0.0
4	0.0
5	0.0
6	3.4
7	1.4
8	1.4

SEE HEC II

✓ 3. The Sloan Channel is currently under design and the applicant must coordinate all improvements with the Clark County Public Works Design section;

2325-A RENAISSANCE DRIVE • LAS VEGAS, NEVADA 89119 • (702) 795-7870 • FAX (702) 795-3696

X 4. The current scale of 1-inch = 60 feet may not be legible when the required tc, road centerline elevations, and finished contours are added. If the plan cannot be legible to microfilm, the scale must be changed;

✓ 5. The grading plan will be reviewed by the building department to ensure compliance with the handicap access requirements (see attached letter). Revisions to the grading plan may be required if the site accessibility design does not comply with the requirements set forth in the Accessibility Chapter of the Clark County Building Code;

✓ 6. Clark County Regional Flood Control District concurrence is required since the site is located within Flood Zone A and adjacent to a regional facility. As a condition of final approval, the applicant must submit a copy of the drainage study and any addenda to the Clark County Regional Flood Control District. The final map will not be approved by the Board of County Commissioners until concurrence is obtained from the Clark County Regional Flood Control District:

HAS BEEN SUBMITTED

✓ 7. At the request of Clark County Public Works, grading plans for the proposed development have been reviewed for compliance to permitting requirements according to Section 34.030 of the "Uniform Regulations for the Control of Drainage," revised November 12, 1990. **The plans submitted do not meet the minimum requirements and must be revised prior to Drainage Study approval, to address the following:**

- ✓ a. Existing pavement, show sawcut and replace areas, pavement transitions
- ✓ b. Typical road sections
- ✓ c. Profile, HGL for proposed storm drains
- ✓ d. Proposed contours
- ✓ e. Crown elevations at lot lines and extension of lot lines
- ✓ f. Details at property lines, fences, and berms
- ✓ g. Details of flood walls and retaining walls
- X h. Detail of proposed or future block wall opening with flowline elevation

THERE ARE NO OPENINGS.

The grading plan has been red-lined and is being returned to the engineer. The red-lined grading plan must be resubmitted with the revised drawings. Failure to resubmit the red-lined grading plan will prevent further review of the project.

All addenda must be submitted directly to Clark County. Any drainage studies or addenda submitted directly to Willdan will be returned to Clark County for the necessary log-in procedures.

The items listed herein must be thoroughly addressed and submitted for review prior to acceptance of this study.

A study review workshop with Willdan Associates may be scheduled if there are questions concerning the above listed comments.

COMMENTS:

Item 3 - This study must be reviewed and commented by the CCPW Design Division regarding the storm drain on Stewart and the Sloan Channel. It is the engineer's responsibility to forward a copy of this study and all addenda to the CCPW Design. No approval shall be given until after the approval by the CCPW Design.

SECTION I: INTRODUCTION

INTRODUCTION

The purpose of this report is to present a drainage study for the Collins Business Park, Phase II development (formerly entitled Craig and Lamb). This report will also present the analysis and design of the regional flood control facility #RWWE 0027. This facility intersects the southwest corner of the site. Collins Business Park is a proposed industrial development, located at the southeast corner of Craig Road and Lamb Boulevard in an unincorporated area of Clark County (Figure 1).

The Developer will divide the proposed development into two phases. Phase II is located immediately north of Alexander Road and approximately 1200-feet south of Craig Road. Phase I lies immediately north of Phase II. The Phase I hydrology study, entitled, "*Onsite Hydrology Study of the Interim Condition for Collins Business Park, Phase I,*" has been submitted to the Clark County Department of Public Works in April, 1995 by Engineers and Surveyors Inc. (ESI). This study is currently in the approval process. Since flow from the Collins Business Park, Phase I development directly impacts the Phase II boundary, flows from the Phase I Hydrology Study will be referenced throughout this report (See Figure 1 for the location of each Phase).

A conceptual hydrology study for Collins Business Park was completed by Engineers and Surveyors Inc. in January, 1994. This report was entitled *Conceptual Drainage Study for Craig and Lamb*. The conceptual study was approved by Clark County on March 7, 1994. A review of this report proved to contain an accurate assessment of offsite flows. This previous study has addressed all offsite flows impacting the proposed Collins Business Park development, and will be referenced throughout this report.

This report will identify any natural washes, as well as any existing drainage facilities that contribute runoff to the proposed development during a 100-year, 6-hour storm event. Recommendations on making improvements necessary to control stormwater generated by the 100-year, 6-hour storm event will be provided to the design engineer, the developer, and the Clark County Public Works Department. This study was conducted in accordance with the criteria set forth by the *1991 Clark County Regional Flood Control District (CCRFCD) Hydraulic Criteria and Design Manual.*

LEGAL DESCRIPTION

The site is located within a portion of the southwest quarter (SW 1/4) of Section 05, of Township 22 South, Range 62 East, M.D.M., Clark County, Nevada.

FLOOD HAZARD ZONE

A review of the *Flood Insurance Rate Map (FIRM)*, Community Panel Number 320003 1025 B, effective September 29, 1989, indicates a finger of Zone A (approximately 11 acres) traverses the southwestern portion of the site. Zone A is an area of 100-year flood hazards, with base flood elevations and flood hazard factors not determined. The remaining area of the project (approximately 32.2 acres), lies within Zone X; an area determined to be outside 500-year flood plain. Figure 2 shows the project location depicted on the FIRM.

FLOOD CONTROL FACILITIES

According to the *1991 Flood Control Master Plan Update for the Las Vegas Valley*, the planned regional facility (RWWE 0027) crosses the southwestern portion of the development. This planned facility will convey flows from the Western Finger of the Western Tributary of Range Wash. According to the *Master Plan Update*, the channel will be concrete lined, approximately 20-feet wide and 6-feet deep with 2:1 side slopes. The proposed discharge for this channel is approximately 2,200 cubic feet per second (cfs). Figure 3 shows the project location on the Master Plan Update.

PREVIOUS DRAINAGE STUDIES

The following drainage study was utilized in the preparation of this study:

Conceptual Drainage Study for Craig and Lamb, Engineers and Surveyors Inc. submitted January 5, 1994.

Onsite Hydrology Study for Interim Conditions of Collins Business Park, Phase I, Engineers and Surveyors Inc., submitted April 11, 1995.

SECTION II: SITE DESCRIPTION

EXISTING SITE DESCRIPTION

Collins Business Park, Phase II, encompasses approximately 43.2 acres and currently consists of undeveloped desert. The ground cover is poor with sparse desert shrub. The site slopes from the northwest to the southeast at approximately 0.65 percent. Washes of various sizes traverse the site in a southeast direction. The Western Finger Wash traverses across the site from the western boundary to the southeastern corner of the site. The site is bordered by existing residential homes to the east and a newly graded area (Collins Business Park, Phase I) to the north. Alexander Road lies south of the site and Lamb Boulevard lies to the west. Lamb Boulevard is paved and fully improved. Alexander Road is an improved half street and will be fully improved with the construction of this project.

The primary soil located in the portion of the proposed Phase II development is listed in the *Soil Conservation Service (SCS), Soil Survey of the Las Vegas Valley* as Casage (Unit #140). This soil is formed in mixed alluvium, derived dominantly from limestone and gypsiferious sediment. Casage (hydrologic soil group C) is a well drained soil that can be found on erosional fan remmants. The secondary soil in the area is listed in the *SCS Soil Survey* as Arizo (Unit #117). Arizo (hydrologic soil group A) is a very gravelly fine sandy loam formed in alluvium derived from various kinds of rock. Arizo is an excessively drained soil that can be found on alluvial fans and inset fans. A small portion of the soil onsite is classified as Pits, gravel (Unit #610). Pits, gravel (hydrologic soil group D), consists of open excavations from which soil material and gravel have been removed, exposing rock, a hardpan, or other material. Figure 4 shows the project location depicted on the SCS Soil Survey.

EXISTING DRAINAGE DESCRIPTION

The proposed site is located within the southern end of the Western Finger of the Western Tributary of Range Wash Watershed. This watershed originates within the Las Vegas Mountain Range and terminates at Alexander Road, east of Lamb Boulevard. The Western Finger Wash intersects the site in a natural channel from the west. This channel conveys flow southeast from the existing triple, 9-ft. X 6-ft. reinforced concrete box culverts (RCBC) under Lamb Boulevard to four, 12-ft. X 7-ft. RCBCs under Alexander Road.

The existing drainage calculations within the *Conceptual Drainage Study for Craig and Lamb* (ESI, January 1994) show utilizing Inlet Control Charts that the existing, triple 9-ft. X 6-ft. RCBC under Lamb Boulevard is not capable of intercepting the total flow of 2140 cfs from the Western Finger Wash. In the 100-year, 6-hour storm event, approximately 1809 cfs of the 2140 cfs is intercepted by the triple RCBC. Therefore, approximately 331 cfs appears to over-top the natural wash, flowing into Lamb Boulevard. A portion of this flow may impact the southwestern boundary of the site.

The existing drainage swale located just north of Alexander Road along the southern boundary of the site, confluences with the Western Finger Wash at the four RCBCs. The swale is approximately five feet deep and drains an existing 48-inch reinforced concrete pipe (RCP). This RCP is located at the northeast corner of Lamb Boulevard and Alexander Road. Current survey information shows that the existing stormdrain system at the corner of Lamb Boulevard and Alexander Road appears to drain to the west, parallel with the existing street grade. This study assumes that the existing 48-inch RCP at the swale will convey the flow from the eastern inlet at the corner of Lamb Boulevard and Alexander Road to the existing swale (approximately 12 cfs).

Rainfall impacting the site is currently conveyed by shallow sheet flow and concentrated flow within one of various washes towards the southeast. Offsite runoff from the north currently flows toward the site from the Phase I development. This runoff impacts Phase II at two locations. The first location consists of an earthen channel located along the eastern boundary of the development. The second location is Flossmoor Street. This street will extend south through the site to Alexander Road. Flows from these areas are currently being intercepted by the four existing RCBCs at Alexander Road.

INTERIM SITE DESCRIPTION

The interim condition of Collins Business Park, Phase II, will consist of three sheet graded areas. The first area will be located east of Flossmoor Street (Pad A). Pad A will encompass approximately 4.4 acres and will slope from the northwest to the southeast at approximately 0.5 percent. The second area (Pad B) will encompass approximately 18.2 acres and will be located between Flossmoor Street and the proposed drainage channel. Pad B will slope from the west to the east at one percent. The third area (Pad C) will be located west of the proposed drainage channel. Pad C will encompass approximately 12.9 acres and will slope from the west to the east at approximately 0.41 percent (See the Proposed Onsite Drainage Basin Map). Approximately 1500-ft. of concrete lined channel will be constructed along the same alignment as the large existing wash. This proposed channel will extend from the existing triple RCBCs under Lamb Boulevard, to the four existing RCBCs under Alexander Road.

Flossmoor Street will consist of a 60-ft right-of-way. Full street improvements will be constructed for all the interior streets. Access to the site will be provided from Alexander Road and Lamb Boulevard.

INTERIM DRAINAGE DESCRIPTION

The site will be graded such that onsite runoff will follow similar flow paths to the pre-developed conditions. Rainfall impacting Pad B will be conveyed within Flossmoor Street to the south, where it will be intercepted by drop inlets and will discharge into the proposed channel. Pad A will be graded so that runoff will be conveyed within the earthen channel, located along the eastern boundary of the site. This channel is the continuation of the earthen channel described in the Phase I report. It will discharge runoff into three proposed 54-inch RCPs, located just north of Alexander Road and east of Flossmoor Street. Runoff from Pad C will be intercepted by the proposed fully improved channel. With the improvements of Alexander Road, the proposed 48-inch RCP will be extended to the four RCBCs. In order to intercept runoff impacting Alexander Road, a modified 20-foot type"C" drop-inlet with four grates will be placed along the northern half of Alexander Road at the four RCBCs. Because of the existing drainage problems at the southeast corner of the site, this project will intercept most of the offsite flows prior to reaching the low point. Please note that the proposed site will not add any flow to this proposed 48-inch RCP.

SECTION III: HYDROLOGIC ANALYSIS

HYDROLOGIC METHODOLOGY AND CRITERIA

The *U.S. Army Corps of Engineers HEC-1 Flood Hydrograph Package* was used to determine the peak runoff generated by the 100-year, 6-hour storm event. The HEC-1 computer model has the ability to simulate the surface runoff response of a given basin to rainfall. The HEC-1 program represents the basin as an interconnected system of hydraulic components. Each component models an aspect of the rainfall runoff process within a portion of the entire basin. This smaller basin portion is referred to as a sub-basin. The computed hydrographs from each sub-basin are then combined at appropriate locations, from which a final discharge is obtained. HEC-1 parameter calculations are included in Appendix A.

Basin Area

The existing onsite areas were determined from the existing 100-scale topographic map. The onsite areas of the interim conditions were determined from the proposed 100-scale interim grading plan. These areas were delineated in order to determine the discharge resulting from the 100-year, 6-hour storm event at various points throughout the project. The HEC-1 drainage basin maps can be found in the map pockets at the end of this report.

Precipitation

The project site is located within the McCarran Airport Rainfall Area. A point depth precipitation of 2.77 inches was obtained from the Depth-Duration-Frequency Values for the 100-year, 6-hour storm event within the McCarran Airport Rainfall Area. The site encompasses less than ten square miles therefore the Storm Distribution Number of three was used for the HEC-1 model.

Hydrologic Abstractions

The SCS curve number method was used to determine the infiltration rates for the project. The soil groups for the project site were determined using the *SCS Soil Survey of the Las Vegas Valley Area.* Curve numbers for this area were calculated using Table 602, "Runoff Curve Number: Urban Areas" and Table 602, "Runoff Curve Numbers: Semiarid Rangelands". Composite curve number calculations for the existing and proposed conditions have been included in Appendix A.

SCS Lag-Time with Time of Concentration

Lag-time, T_L, is defined as the time measured from the centroid of effective rainfall to the peak of the outflow hydrograph. It is a measure of the watershed's response time and is a coherent property to basin length, slope, roughness characteristics, and land use.

Lag-times for the study were estimated by calculating the basins time of concentration, T_c. The time of concentration consists of two component of time, t_i, and the gutter or channel flow time, t_t. The equation for the time of concentration is: $T_c = t_i + t_t$

Lag-times can be found by the following equation: $T_L = 0.6T_c$

Drainage Patterns

Precipitation in the Las Vegas Valley is characterized typically by long duration, low intensity winter storms and by short duration, high intensity summer storms. The winter storms, in general, do not produce major flooding events, whereas the summer storms can and do produce major flash flooding hazards in the Las Vegas Valley Area.

Due to the phenomenon of the storm centering, two HEC-1 analyses were completed. The first HEC-1 analysis modeled the flows which directly impact the site. Therefore, the storm was assumed to be centered directly over the site. Flows that are conveyed to the existing lo-hed culverts were calculated with this analysis.

Flows in the second HEC-1 analysis were used for the design of the proposed regional facility that crosses the site. The storm was assumed to be centered over the entire watershed that contributes flows to the channel. Flows for the second HEC-1 analysis were determined in the previous study entitled, *"Conceptual Drainage Study for Craig and Lamb"* ESI, January, 1994.

SECTION IV: HYDROLOGIC RESULTS

EXISTING DRAINAGE ANALYSIS

Runoff from the northern offsite areas (Phase I and the northerly offsite areas) discharge approximately 390 cfs into the graded earth channel located at the northeast corner of the site. This flow, and the flow from Basins ON3E-ON5E, contribute approximately 418 cfs to the four RCBCs located under Alexander Road. Approximately 88 cfs (Basins ON1E, ON2E, and spill over from Lamb Boulevard) is intercepted by the existing drainage swale, located along the southern boundary of the site. This swale confluences with the Western Finger Wash at the four RCBCs. The total 100-year runoff impacting the southeast corner of the Collins Business Park, Phase II, is approximately 506 cfs. The Western Finger Wash contributes a total of 2140 cfs to the four, existing RCBCs located under Alexander Road. The onsite drainage basin map of the existing conditions is included in Map Pocket 1. Table 1 shows the existing drainage conditions for the individual basins.

TABLE 1
100-YEAR FLOWS
EXISTING CONDITIONS

BASIN	AREA (acres)	FLOW (cfs)
ON1E	6.15	2
ON2E	8.45	3
ON3E	2.85	2
ON4E	7.90	11
ON5E	13.50	16
LAMB	5.58	13
Flow impacting from Phase I	N/A	390
Flow impacting site from Lamb	N/A	83
Flow in Western Finger Wash	N/A	1809
Total flow @ four Ex. RCBs	N/A	2140

INTERIM DRAINAGE ANALYSIS

The HEC-1 analysis calculated a proposed 100-year, 6-hour storm discharge of approximately 31 cfs for Basins ON7D, and ON8D. This flow, and the flow within Flossmoor Street from Phase I (approximately 77 cfs) will be intercepted by two proposed 20-ft. Type "C" drop-inlets with double grates, within Flossmoor Street, just north of Alexander Road (See Appendix E for inlet capacity calculations.)

Flow impacting the site from Lamb Boulevard (approximately 83 cfs), and flow from Basin ON10D (approximately 14 cfs) contribute approximately 97 cfs to the flow within the proposed channel, which crosses the site. Flow from the eastern half of Lamb Boulevard and Basin ALEX (approximately 81 cfs) will be intercepted by the proposed 20-ft. Type "C" drop-inlets with four grates, located along the north side of Alexander Road.

A portion of the existing residential development located at the southeast corner of the site contributes approximately 3 cfs to the low point on the north side of Alexander Road. This flow will be collected at the proposed sidewalk opening and will ultimately discharge into the proposed earthen channel. Because of grading constraints within this area of the site, the proposed hydraulic grade line (HGL) within the earthen channel will be above the top-of-curb elevation at this point in Alexander Road. To alleviate flooding in this area, the 18-inch outlet pipe will be equipped with a flap gate to prevent flows within the channel from inundating Alexander Road and increasing the flooding problem.

The earthen channel along the eastern boundary of Phase I will continue to be built with the development of Phase II. This channel will be constructed along the eastern boundary of the site and outlet flow into a proposed triple 54-inch RCP culvert underneath Flossmoor Street. The earthen channel is capable of conveying the 100-year storm of approximately 400 cfs. The proposed triple, 54-inch RCPs will allow flow from the proposed earthen channel to discharge into the proposed Western Finger Channel at the southeast corner of the site (See Map Pocket 2 for cross section of the earthen channel and the location of the triple RCP culverts.) Inlet Control Chart was used to determine the allowable flow at the entrance to the triple, 54-inch RCP culverts.

For the 10-year event, a 32-foot dry lane will exist in each travelling directions on Alexander Road. Lamb Boulevard will provide approximately 31-feet of dry-lane for emergency vehicles in each direction (See Appendix D for calculations.)

The drainage analysis for Basins ON1D-ON6D can be found in the Phase I study. Table 1 shows the proposed drainage conditions for the individual basins. The onsite drainage basin map of the interim conditions is located in Map pocket 2. The HEC-1 analysis for the interim conditions can be found in Appendix C. Street and channel capacity calculations can be found in Appendix D.

SECTION V: HYDRAULIC METHODOLOGY AND CRITERIA

HYDRAULIC METHODOLOGY AND CRITERIA

The *U.S. Army Corp of Engineers' HEC-2 Water Surface Profile* computer model was utilized in the design of the proposed concrete channel through the development. The HEC-2 computer program has the capability of calculating water surface profiles for steady gradually varied flow in natural streams, rivers and improved flood control channels. The effects of structures such as bridges, culverts, weirs and other structures within the floodplain may be considered in the calculations.

The computational procedure is based on solving the one-dimensional energy equation with energy loss due to friction evaluated with Manning's Equation. This procedure of calculating water surface profiles is known as the "Standard Step Method." The HEC-2 model can analyze both sub-critical and super-critical flow profiles.

Input parameters for the HEC-2 model include the channel cross section, roughness characteristics, starting water surface elevation, design storm discharge and reach lengths between consecutive cross sections.

The channel cross sections were input into the HEC-2 program as a templet, with slopes and ground elevations the only parameters which changed for a given reach within the improved portion of the channel. Culverts were input as a rectangular channel with piers. The X2 card was utilized to define the culverts top of box and bottom of roadway.

The roughness coefficient for the box culverts was estimated to be 0.013. The roughness values for the improved channel was estimated at 0.015. The roughness value utilized for the natural wash upstream and downstream of the project was estimated to be 0.025.

The starting water surface elevation was obtained by a trial and error procedure, as outlined in the HEC-2 Users Manual. A starting water surface elevation was estimated and the slope of the energy grade line was adjusted until a 25 convergence was reached.

The design storm discharge is the current 100-year, 6-hour flow rate, determined in the approved *"Conceptual Hydrology Study for Craig and Lamb."* A 100-year, 6-hour discharge of 2,140 cfs was utilized for the design. The HEC-2 analysis is located in Appendix F.

The HEC-2 analysis began approximately 500-ft. downstream of Alexander Road. This section is an existing, unimproved earthen channel with varying width and depth. Engineers and Surveyors, Inc. (ESI) obtained cross sectional survey information of the wash for this analysis. This section of the Western Finger of Ranch Wash discharges into an existing, improved concrete lined channel at Las Vegas Boulevard North.

The HEC-2 analysis terminates approximately 300-ft. upstream of Lamb Boulevard. Due to the submergence of the existing triple box culvert under Lamb Boulevard, the special bridge method was used for this crossing.

SECTION VI: HYDRAULIC RESULTS

HYDRAULIC RESULTS

The results of the HEC-2 analysis indicate that the existing triple 9-ft. X 6-ft. RCBC upstream of Lamb Boulevard does not have adequate capacity to convey the 100-year discharge of 2140 cfs under Lamb Boulevard. Approximately 331 cfs will spill out of the channel at this location and flow south within Lamb Boulevard. It appears that the existing RCBCs crossing under Lamb Boulevard was undersized for the construction of Lamb Boulevard, as it does not correlate with the recommendations in the *1991 Master Plan Update*.

The street right-of-way is capable of conveying approximately 178 cfs to the top of crown. The remaining flow (approximately 83 cfs) will be conveyed within the existing undeveloped areas along both sides of Lamb Boulevard to Alexander Road.

CHANNEL DESIGN

Proposed channel improvements will originate at the eastern side of Lamb Boulevard and terminate at the northern boundary of Alexander Road. The channel will be 1500-ft. long, and will transition in top-width from 59-ft. at Lamb Boulevard to 71-ft. at Alexander Road. The increase in width is due to the higher flow depths at the entrance of the four, 12-ft. X 7-ft. RCBCs. The channel will have a constant longitudinal bed slope of 0.78% and a transverse slope of 2% to the channel flow line.

The channel is trapezoidal in shape, with a 32-ft. bottom width, 2:1 side slopes and a total depth varying from 6.5-ft. to 9.0-ft. This depth includes an average of 1.5-ft. of freeboard. Table 6 shows the stations, channel water surface elevations, and velocities.

A ramp will be provided at the eastern side of Lamb boulevard for access to the channel bottom for the required routine maintenance. A ramp will not be provided downstream at Alexander Road due to potential flow "run-up" problems. The channel has been designed with an adequate bottom width to provide for "U-turns". A six foot high chain link fence will be constructed around the perimeter of the proposed channel to inhibit unauthorized personnel from entering the facility.

Inlet Control Charts were used to determined the allowable flows for the three existing 6-ft. x 9-ft. RCBCs under Lamb Boulevard, the four existing 7-ft. x 12-ft. RCBCs under Alexander Road, and the proposed triple 54-inch RCPs at the corner of Flossmoor Street and Alexander Road. The three RCBCs, four RCBCs, and the triple 54-inch RCPs are capable of intercepting approximately 1809 cfs, 3840 cfs, and 480 cfs respectively. These Inlets Control Charts and calculations are included in Appendix E.

TABLE *6*
HEC-2 ANALYSIS
PROPOSED CONCRETE CHANNEL - SUB CRITICAL RUN

SECTION VII: SUMMARY

RECOMMENDATIONS

The following recommendations are provided to facilitate safety, both public and private, for the proposed industrial development.

1. The site should be graded as shown on the enclosed grading plan to insure flood protection from the 100-year, 6-hour storm event for the fully developed conditions. In the future, finished floors will be placed a minimum of 18-inches above the 100-year water surface elevations.

2. Construct the flood control facilities as shown on the Improvement Plans to safely direct onsite and offsite flows through the development to the four RCBCs, located at the southeast corner of the site.

3. Regular maintenance of the proposed flood control facilities to insure proper efficiency.

CONCLUSION

Collins Business Park, Phase II, is a proposed industrial development, planned to be constructed in Clark County. The site will be designed to convey existing offsite flows north of Craig Road and west of Lamb Boulevard to the four existing RCBCs, located at the southeast corner of the site. Approximately 2140 cfs is conveyed through the site and discharges to the southeast in a proposed concrete channel. The proposed earthen channel located along the eastern boundary of the site will convey offsite flow north of Lamb Boulevard and most of the onsite flow (approximately 400 cfs) to the proposed triple, 54-inch RCPs, which will be confluence with the four RCBCs at the corner of Flossmoor Street and Alexander Road.

It is the opinion of this firm that this report is complete in its entirety and all hazards have been investigated and dealt with individually and completely.

RUNOFF CURVE NUMBERS
(URBAN AREAS[1])

Cover description		Curve numbers for hydrologic soil group—			
Cover type and hydrologic condition	Average percent impervious area[2]	A	B	C	D
Fully developed urban areas (vegetation established)					
Open space (lawns, parks, golf courses, cemeteries, etc.)[3]:					
Poor condition (grass cover < 50%)		68	79	86	89
Fair condition (grass cover 50% to 75%)		49	69	79	84
Good condition (grass cover > 75%)		39	61	74	80
Impervious areas:					
Paved parking lots, roofs, driveways, etc. (excluding right-of-way)		98	98	98	98
Streets and roads:					
Paved; curbs and storm sewers (excluding right-of-way)		98	98	98	98
Paved; open ditches (including right-of-way)		83	89	92	93
Gravel (including right-of-way)		76	85	89	91
Dirt (including right-of-way)		72	82	87	89
Western desert urban areas:					
Natural desert landscaping (pervious areas only)[4]		63	77	85	88
Artificial desert landscaping (impervious weed barrier, desert shrub with 1- to 2-inch sand or gravel mulch and basin borders)		96	96	96	96
Urban districts:					
Commercial and business	85	89	92	94	95
Industrial	72	81	88	91	93
Residential districts by average lot size:					
1/8 acre or less (town houses)	65	77	85	90	92
1/4 acre	38	61	75	83	87
1/3 acre	30	57	72	81	86
1/2 acre	25	54	70	80	85
1 acre	20	51	68	79	84
2 acres	12	46	65	77	82
Developing urban areas					
Newly graded areas (pervious areas only, no vegetation)[5]		77	86	91	94

[1]Average runoff condition, and $I_a = 0.2S$.
[2]The average percent impervious area shown was used to develop the composite CN's. Other assumptions are as follows: impervious areas are directly connected to the drainage system, impervious areas have a CN of 98, and pervious areas are considered equivalent to open space in good hydrologic condition. CN's for other combinations of conditions may be computed using figure 603
[3]CN's shown are equivalent to those of pasture. Composite CN's may be computed for other combinations of open space cover type.
[4]Composite CN's for natural desert landscaping should be computed using figure 603 based on the impervious area percentage (CN = 98) and the pervious area CN. The pervious area CN's are assumed equivalent to desert shrub in poor hydrologic condition.
[5]Composite CN's to use for the design of temporary measures during grading and construction should be computed using figure 603 based on the degree of development (impervious area percentage) and the CN's for the newly graded pervious areas.

RUNOFF CURVE NUMBERS
(SEMIARID RANGELANDS[1])

Cover description		Curve numbers for hydrologic soil group—			
Cover type	Hydrologic condition[2]	A[3]	B	C	D
Herbaceous—mixture of grass, weeds, and low-growing brush, with brush the minor element.	Poor		80	87	93
	Fair		71	81	89
	Good		62	74	85
Oak-aspen—mountain brush mixture of oak brush, aspen, mountain mahogany, bitter brush, maple, and other brush.	Poor		66	74	79
	Fair		48	57	63
	Good		30	41	48
Pinyon-juniper—pinyon, juniper, or both; grass understory.	Poor		75	85	89
	Fair		58	73	80
	Good		41	61	71
Sagebrush with grass understory.	Poor		67	80	85
	Fair		51	63	70
	Good		35	47	55
Desert shrub—major plants include saltbush, greasewood, creosotebush, blackbrush, bursage, palo verde, mesquite, and cactus.	Poor	63	77	85	88
	Fair	55	72	81	86
	Good	49	68	79	84

[1]Average runoff condition, and $I_a = 0.2S$.

[2]*Poor:* <30% ground cover (litter, grass, and brush overstory).
Fair: 30 to 70% ground cover.
Good: >70% ground cover.

[3]Curve numbers for group A have been developed only for desert shrub.

ATT: **Robert Thompson, P.E.**

RE: Onsite Hydrology Study for Collins Business Park, Phase II & Channel Design for CCRFCD Facility # RWWE 0027
H.T.E.# 95-12569
Willdan #1814

Dear Mr. Thompson,

This letter is in response to the Clark County Regional Flood Control District comments, dated January 10, 1996, in regards to the above referenced project.

Comment 1: **The consultant quantified a Q100 of 265 cfs crossing subbasin ON1E in the existing condition. It must be demonstrated that diverting this 265 cfs, through placement of the proposed berm along the westerly property line, does not create an adverse impact to Lamb Blvd. or properties on the westerly side of Lamb.**

Response 1: The hydrology study is intended to analyze the hydrologic and hydraulic conditions of the site in interim conditions. The interim site will be graded to allow the 265 cfs to sheet flow across the site ultimately discharging into the proposed channel. In the future, when a site plan is prepared for the area bounded by the channel to the north and east and by Lamb Boulevard and Alexander Road to the west and south, a technical drainage study will be submitted. Drainage conveyance systems and finish floor elevations will be designed in accordance with Clark County Public Works (CCPW) drainage criteria. A revised grading plan for the interim condition has been included in map pocket 1.

Comment 2: **The consultant must be directed to provide hydrologic and hydraulic calculations, along with a detailed plan and profile, for the proposed 960' extension of the existing 48" RCP in Alexander Road. If this storm drain is operating under pressure in the existing condition, the extension and new tail water could have a significant impact on the system's capacity. Storm sewer design must be in conformance with the requirements outlined in Section 800 of the District's Hydrologic Criteria and Drainage Design Manual (HC&DDM). The angle of entry to the 12' by 7' RCBC should be at a maximum of 45 degrees. In addition, please advice the consultant to provide a trench detail.**

Response 2: The 48-inch RCP in Alexander Road currently conveys minimal flows. A profile of the RCP has been included in map pocket 2 for your review. As can be seen (Figure 1) the pipe (Segment B) connecting the inlets slopes to the west. The existing 3-foot type B inlets located on Lamb Boulevard contribute a total flow of approximately 24 cfs to the existing pipe system. The flow intercepted by inlet 2 (maximum: 12 cfs) splits at the confluence of segments B and C. Although the maximum flow within segment C, assuming no split, is approximately 12 cfs, a calculation was completed using the Mannings equation, assuming the pipe was at capacity, to demonstrate the total amount of flow the pipe could convey. This amounted to approximately 90 cfs.

Due to existing utilities (Figure 2) the angle of entry for the 48-inch RCP cannot be modified to be 45 degrees. The trench detail has been added to the plans.

Comment 3: **The Manning's roughness coefficient of .013 utilized in the HEC-2 analysis does not coincide with the statement by the engineer in the original submittal that a roughness value of .015 was estimated for the improved channel. If the channel is to be constructed with a trowel finish ("n" = .013), then please advice the engineer to specify a trowel finish on the typical channel sections.**

Response 3: The HEC-2 analyses have been revised to reflect the more accurate Manning's roughness coefficient of 0.015 for the concrete channel. See Appendix A for the revised HEC-2 analyses.

Comment 4: **The HEC-2 analysis submitted for the proposed condition indicates a significant amount of overbank flow is present on each cross section. Please refer the consultant to the U.S. Army Corps of Engineers HEC-2 Water Surface Profiles "User's Manual", Section 3.6, which present an overview on cross section geometry. As noted in this section of the "User's Manual", the X1 card is used to define the left and right stations separating the channel from the overbank area. Overbank stations should be set at the top, not the toe, of the channel being modeled. In addition, the consultant has indicated the "west" channel will be designed to convey a flow of 2140 cfs, yet a Q100 of 1431 cfs has been used in the subcritical model. A revised HEC-2 analysis must be submitted for each flow regime, using the total design flow of 2140 cfs and the correct bank stations in the X1 card. Design flow must be contained within the banks of the channel, with adequate freeboard, depending on the flow regime, as outlined in section 706.1.3 and/or Section 706.2.4 of the HC&DDM. Freeboard calculations must be submitted for each particular reach. As noted in the HC&DDM all channel design submittal must include a calculated Froude number for each unique reach to check the flow state and compliance with the HC&DDM Section 702.2.**

Response 4: The revised HEC-2 analysis was completed using 2140 cfs throughout the channel. Overbank stations have been set at the top of the channel and freeboard calculations are included in Appendix B. The HEC-2 analyses include the Froude number in their output. From the Froude number it was determined that the channel is flowing in a supercritical state. The Froude numbers from the supercritical analysis were checked to verify that the main channel did not fall within the critical limits as outlined in the HC&DDM.

Comment 5: **The typical channel sections must be revised to incorporate the following:**

a) **Reinforcing bar size shall be increase or spacing decreased to conform to the requirements specified in Section 705.7.1.5 of the HC&DDM;**

b) **Channel bedding must be in conformance with section 705.7.1.6 and the geotechnical report;**

c) **A trowel finish must be specified, if appropriate, as previously noted.**

Response 5:

a) The longitudinal and transverse reinforcement has been revised to conform to the requirements specified in the HC&DDM. The longitudinal bars have been increased to #5 bars and the transverse reinforcement has remained the same. As the bar size increased the spacing has remained the same (12-inches on center) per the CCRFCD requirements. See channel plans for revised notes.

b) The channel bedding has been noted on the plans and is in conformance with the HC&DDM and the geotechnical report.

c) A trowel finish is no longer required for the proposed channel.

Comment 6: **Please advice the consultant to provide Improvement plans, profile construction details and hydraulic calculations for the confluence of the (3) 54" RCP and the proposed 12' by 7' RCBC under Alexander Road. It must be demonstrated through the appropriate hydraulic analysis that the proposed RCBC has adequate capacity to convey the additional 390 cfs from the 54" RCP.**

Response 6: The approved hydrology study for this project demonstrated that the three 54" RCP and the RCBC at Alexander Road are well capable of intercepting all onsite and offsite flow for the 100-year flow. See Appendix C for capacity calculations. In addition, the peaking time for the western finger wash is approximately 2.5 hours greater than the peaking time of the localized offsite and onsite flows.

Comment 7: **Concrete cut-off wall locations should be indicated on the channel improvement plans. A concrete cut-off wall should be placed at the upstream end of the proposed improvements, along with a detail of the connection to the existing RCBC structure under Lamb Blvd.**

Response 7: Concrete cut-off wall details and locations have been shown on the revised channel plans. A detail showing the connection to the existing structure under Lamb Boulevard has been added to the plans.

Comment 8 **Ladder type steps shall be placed on each side of the channel at 600' centers, offset at 45 degrees from one bank to the other, to facilitate swift water rescue.**

Response 8: See the attached channel plans for the revised locations of the ladder steps.

Comment 9: **Please advice the consultant to revise the expansion joint shown in SEC H-H, to accommodate movement of the channel lining.**

Response 9: The expansion joint detail has been revised and is shown on the plans.

If you have any further questions or comments, please call me at 248-6415.

Sincerely,
Engineers and Surveyors, Inc.

Dan Le, E.I.T.

APPENDIX B

Revised Superelevation and Freeboard Calculations

22-141 50 SHEETS
22-142 100 SHEETS
22-144 200 SHEETS
AMPAD

REGIONAL FACILITY

SUPERELEVATION CALCULATIONS

$$S_o = \frac{V^2 T_N}{GR}$$

$$= \frac{(13.75)^2 (64)}{(32.2)(370)}$$

SUPERCRITICAL FLOW REGIME

$$S_o = 1.02'$$

FREEBOARD CALCULATIONS

$$F_b = 1 + 0.025 V (d)^{1/3}$$

$$= 1 + 0.025 (13.75)(4.31)^{1/3}$$

$$F_b = 1.56'$$

$d + S_o + F_b \Rightarrow 4.31 + 1.02 + 1.56 = 6.89'$ TOTAL DEPTH

CHANNEL BANK $8' > 6.89'$ $\therefore$ O.K.

SUPERELEVATION CALCULATIONS

$$S_o = \frac{V^2 T_N}{GR}$$

$$= \frac{(7.33)^2 (64)}{(32.2)(370)}$$

SUBCRITICAL FLOW REGIME

$$S_o = 0.33'$$

FREEBOARD CALCULATIONS

$$F_b = 1 + 0.025 V (d)^{1/3}$$

$$= 1 + 0.025 (7.33)(6.4)^{1/3}$$

$$F_b = 1.36'$$

$d + S_o + F_b \Rightarrow 6.4' + 0.33' + 1.36' = 8.09'$

CHANNEL BANK $9' > 8.09'$ $\therefore$ O.K

APPENDIX C

DIKE FILL (STA 55+00 TO 320+00	810,000	CY
SOIL CEMENT (STA 0+00 TO 55+00)	13,000	CY
BULK CEMENT	1095	TON
RIP-RAP WITH FILTER BLANKET	360	CY
SOIL CEMENT SUBGRADE	33,000	SY
CONSTRUCTION WATER MOBILIZATION	1	LS
CONSTRUCTION WATER QUANTITY	90,000	1000 GAL
MISCELLANEOUS SIGNAGE, FENCING AND TRAFFIC CONTROL	1	LS
GRAVEL ROADWAY RELOCATION	1	LS
SEDIMENTATION MONUMENT	31	EA
CONSTRUCTION CONFLICTS	70,000	$

NOTE:

THE CUT AND FILL VOLUMES SHOWN IN TABLE "A" ARE THOSE VOLUMES BETWEEN ORIGINAL GROUND CONTOURS AND NEAT LINES OF EMBANKMENT FILLS AND EXCAVATION CUTS. NO ALLOWANCE HAS BEEN MADE FOR SHRINKAGE, MATERIAL LOSSES DURING CLEARING, GRUBBING, AND STRIPPING OR WASTE. THE CONTRACTOR SHALL TRANSPORT EXCAVATED MATERIAL AS REQUIRED TO COMPLETE FILL EMBANKMENTS SHOULD STATION LIMITS CHANGE BE ENCOUNTERED.

GENERAL NOTES

1. CONTRACTOR SHALL KEEP CONSTRUCTION ACTIVITIES AND WORKERS AWAY FROM ARCHAEOLOGICAL SITE AT EAST END OF PROJECT SITE. IF HISTORICAL OR ARCHAEOLOGICAL REMAINS ARE ENCOUNTERED CONSTRUCTION SHALL BE TEMPORARILY HALTED AND ENGINEER NOTIFIED. SEE SPECIAL PROVISIONS.
2. CONTRACTOR'S WORKERS SHALL UNDERGO DESERT TORTOISE TRAINING AND THEREAFTER COMPLY WITH ALL REGULATIONS AND INSTRUCTIONS PROVIDED BY QUALIFIED DESERT TORTOISE BIOLOGIST. SEE SPECIAL PROVISIONS.
3. ACCESS TO SECTIONS 3,4,9, AND 10 IS CONTROLLED BY NELLIS AIR FORCE BASE (NAFB). ACTIVE SMALL ARMS RANGE IS LOCATED IN SECTION 9. CONTRACTOR SHALL COORDINATE CLOSELY WITH NAFB TO SCHEDULE ACCESS AND CONSTRUCTION ACTIVITIES. NAFB SAFETY PERSONNEL HAVE CONDUCTED A PRELIMINARY "SWEEP" ALONG PROPOSED DIKE ALIGNMENT FOR POSSIBLE UNEXPLODED ORDNANCE. FOLLOWING CONSTRUCTION STAKING, CONTRACTOR SHALL NOTIFY ENGINEER FOR COORDINATION OF POSSIBLE ADDITIONAL ORDNANCE "SWEEP" BY NAFB. IF MEMORIAL OBJECTS ARE DETECTED DURING CONSTRUCTION, CONTRACTOR SHALL TEMPORARILY HALT WORK AND NOTIFY ENGINEER. SEE SPECIAL PROVISIONS.
4. TEMPORARY GATES SHALL BE CONSTRUCTED ACROSS HAUL ROADS WHERE THEY ENTER/EXIT NAFB. THESE GATES SHALL BE OF THE SAME QUALITY AND MATERIAL AS FENCE WHICH IS TEMPORARILY REMOVED.
5. CONSTRUCTION SHALL BEGIN FROM THE DOWNSTREAM END CONTINUING UPSTREAM TO PROVIDE PROTECTION FROM FLOOD WATERS. CONTRACTOR SHALL DIVERT ALL DRAINAGE FROM CHANNELS PRIOR TO EXCAVATION AND BE RESPONSIBLE FOR CONTROL OF ALL STORM WATERS DURING CONSTRUCTION.
6. WHERE THICKNESS OF SOIL CEMENT, RIP-RAP, STRIPPING, PAVEMENT AND SIMILAR DIMENSIONS OF IMPROVEMENTS ARE INDICATED, THEY SHALL BE THE MINIMUM THICKNESS AND DIMENSIONS OF MATERIALS AND IMPROVEMENTS PROVIDED.
7. PHONE REFERENCES NELLIS AIRFORCE BASE:

LEGAL DESCRIPTION

BEING a tract of land situated in Sections 11, 12, 13 and 14, Township 19 South, Range 61 East, M.D.M., and Sections 3, 4, 7, 8, and 9, Township 19 South, Range 62 East, M.D.M., Clark County, Nevada, said tract of land being more particularly described as follows:

COMMENCING at a bronze disc found at the east quarter corner of Section 14, Township 19 South, Range 61 East, M.D.M., Clark County, Nevada;

THENCE North 89°32'29" West 1514.10 feet along the south line of the northeast one quarter of Section 14 to the TRUE POINT OF BEGINNING of the tract herein described;

THENCE North 89°32'30" West, a distance of 300.22 feet along said south line to a point;

THENCE North 29°35'38" East, a distance of 3368.47 feet;

THENCE North 20°07'58" East, a distance of 419.00 feet;

THENCE North 69°31'38" West, a distance of 97.05 feet;

THENCE North 02°08'57" East, a distance of 40.00 feet;

THENCE North 50°40'26" East, a distance of 158.49 feet;

THENCE South 89°36'26" East, a distance of 64.21 feet;

THENCE North 38°51'18" East, a distance of 851.97 feet;

THENCE South 89°04'00" East, a distance of 2392.09 feet;

THENCE South 88°22'37" East, a distance of 2063.62 feet;

THENCE South 87°20'47" East, a distance of 2490.98 feet;

THENCE North 87°36'04" East, a distance of 1863.85 feet;

THENCE North 81°36'00" East, a distance of 2682.36 feet;

THENCE North 76°01'06" East, a distance of 2284.64 feet;

THENCE North 71°23'51" East, a distance of 684.79 feet;

THENCE North 64°00'19" East, a distance of 1967.31 feet;

THENCE North 63°04'27" East, a distance of 1993.51 feet;

THENCE North 61°05'56" East, a distance of 1564.90 feet;

THENCE North 64°15'47" East, a distance of 1192.45 feet;

THENCE North 56°10'13" East, a distance of 964.67 feet;

THENCE North 54°13'44" East, a distance of 990.06 feet;

THENCE North 49°39'59" East, a distance of 1123.03 feet to the beginning of a curve to the left having a radius of 725.00 feet, a central angle of 26°04'16" and a long chord which bears North 36°37'42" East 327.06 feet;

THENCE along said curve a distance of 329.89 feet to a point of reverse curvature with a curve to the right having a radius of 1079.00 feet, a central angle of 54°03'58" and a long chord which bears North 51°37'23" East 1010.46 feet;

THENCE along said curve a distance of 1091.93 feet to the point of tangency;

THENCE North 79°39'32" East, a distance of 1056.22 feet;

THENCE North 64°18'51" East, a distance of 204.91 feet;

THENCE South 70°43'17" East, a distance of 306.49 feet;

THENCE South 11°16'43" West, a distance of 310.00 feet;

THENCE North 70°43'17" West, a distance of 204.88 feet;

THENCE South 64°18'51" West, a distance of 223.06 feet;

THENCE South 79°39'32" West, a distance of 1097.98 feet to the beginning of a curve to the left having a radius of 765.00 feet, a central angle of 56°03'58" and a long chord which bears South 51°37'33" West 719.07 feet;

THENCE along said curve a distance of 748.58 feet to a point of reverse curvature with a curve to the right having a radius of 1035.00 feet, a central angle of 26°04'16" and a long chord which bears South 36°37'42" West 466.90 feet;

THENCE along said curve a distance of 470.98 feet to the point of tangency;

THENCE South 49°39'59" West, a distance of 30.00 feet;

THENCE South 40°20'10" East, a distance of 125.00 feet;

GENERAL NOTES

1. THE INTENT OF THIS PROJECT IS TO CONSTRUCT VARIOUS FLOOD CONTROL IMPROVEMENTS WITHIN CLARK COUNTY. PHASE I IMPROVEMENTS INCLUDE A CHANNEL THROUGH NAFB GOLF COURSE TO DIVERT MAJOR FLOWS TO THE DETENTION BASIN, UTILITY LOCATION, BRIDGES AND ROADWAY IMPROVEMENTS. PHASE II IMPROVEMENTS CONSIST OF A DIVERSION STRUCTURE; A DETENTION BASIN WITH OUTLET AND SPILLWAY STRUCTURES; AND AN OUTFALL CHANNEL FROM THE DETENTION BASIN.
2. ALL CONSTRUCTION SHALL BE IN ACCORDANCE WITH THE "IMPROVEMENT STANDARDS", MAY 1990, AS REVISED, AND "UNIFORM STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION", 1986, CLARK COUNTY, NEVADA, UNLESS OTHERWISE SPECIFIED BY NOTE ON PLANS AND SPECIAL PROVISIONS OR AS DIRECTED BY THE ENGINEER. THE CONTRACTOR SHALL MAINTAIN A SET OF THESE STANDARDS AT THE JOBSITE AT ALL TIMES.
3. ALL UTILITY COMPANIES SHALL BE NOTIFIED AT LEAST 48 HOURS PRIOR TO BEGINNING CONSTRUCTION.
4. THE EXISTENCE AND LOCATION OF UNDERGROUND UTILITY PIPES OR STRUCTURES SHOWN ON PLANS FOR CONTRACTOR'S CONVENIENCE WERE OBTAINED BY A SEARCH OF AVAILABLE RECORDS. THE OWNER ASSUMES NO RESPONSIBILITY FOR UTILITIES OR STRUCTURES NOT OF RECORD, OR NOT IN THE LOCATION OF RECORD. THE CONTRACTOR'S LIABILITY REGARDING ANY DAMAGED UTILITY IS SET FORTH IN SECTION 105 OF THE STANDARD SPECIFICATIONS AND SPECIAL PROVISIONS.
5. THE CONTRACTOR SHALL, AT HIS OWN EXPENSE, LOCATE ALL OVERHEAD INTERFERENCES WHICH MAY AFFECT HIS OPERATION DURING CONSTRUCTION AND SHALL TAKE ALL NECESSARY PRECAUTIONS TO AVOID DAMAGE TO SAME. THE CONTRACTOR SHALL USE EXTREME CAUTION WHEN WORKING NEAR OVERHEAD OR UNDERGROUND POWER, GAS AND/OR OTHER UTILITIES SO AS TO SAFELY PROTECT ALL PERSONNEL AND EQUIPMENT, AND SHALL BE RESPONSIBLE FOR ALL COSTS AND LIABILITY IN CONNECTION THEREWITH.
6. THE CONTRACTOR IS REQUIRED TO TAKE PRECAUTIONARY MEASURES TO PROTECT ALL EXISTING IMPROVEMENTS REMAINING IN PLACE, AND ANY IMPROVEMENTS OR STRUCTURES DAMAGED BY THE CONTRACTOR SHALL BE REPAIRED OR RECONSTRUCTED AT THE EXPENSE OF THE CONTRACTOR.
7. THE CONTRACTOR SHALL TAKE ALL PRECAUTIONS NECESSARY TO PROTECT EXISTING PERMANENT SURVEY MONUMENTS, ANY MONUMENTS DISTURBED SHALL BE REPLACED AND ADJUSTED, AT THE EXPENSE OF THE CONTRACTOR, PER AVAILABLE RECORDS IN ACCORDANCE WITH NEVADA REVISED STATUTE NUMBER 625.550.
8. ALL BARRICADING AND TEMPORARY TRAFFIC CONTROL DEVISES OR METHODS TO BE USED DURING CONSTRUCTION SHALL BE DONE IN ACCORDANCE WITH THE STATE OF NEVADA "TRAFFIC CONTROL MANUAL", LATEST EDITION, AND WITH THE "U.S. MANUAL ON UNIFORM TRAFFIC CONTROL DEVISES", LATEST EDITION, 1988.
9. CONSTRUCTION SCHEDULING SHALL MINIMIZE DISTURBANCE TO THE NORMAL PLAY ON THE GOLF COURSE. THE PLAY FOR HOLE NUMBER 2 SHALL NOT BE CLOSED. A TEMPORARY NEW TEE SHALL BE ESTABLISHED BY OTHERS ON THE LEFT SIDE OF THE CHANNEL CONSTRUCTION, TEMPORARILY REDUCING THE LENGTH OF THE FAIRWAY. HOLE NUMBER 3 SHALL BE TEMPORARILY CLOSED DUE TO CHANNEL CONSTRUCTION. ALL OTHER HOLES TO REMAIN OPEN FOR NORMAL PLAY.
10. PRIOR TO CHANNEL EXCAVATION, IRRIGATION AND OTHER AFFECTED UTILITIES IN THE GOLF COURSE, SHALL BE THOROUGHLY INVESTIGATED BY A NONDESTRUCTIVE MEANS OF EXCAVATION. ALL UTILITIES, OTHER THAN FOR IRRIGATION, SHALL BE RELOCATED, TO NOT INTERFERE WITH CHANNEL CONSTRUCTION, PRIOR TO BEGINNING CHANNEL EXCAVATION.
11. IRRIGATION FACILITIES SHALL BE RELOCATED TO NOT INTERFERE WITH CHANNEL CONSTRUCTION PRIOR TO BEGINNING CHANNEL EXCAVATION, IF REASONABLE TO DO SO. IF IRRIGATION FACILITIES CANNOT REASONABLY BE COMPLETELY RELOCATED, TEMPORARY FACILITIES SHALL BE PROVIDED AND MAINTAINED TO PROVIDE CONTINUED OPERATION EACH SIDE OF THE CONSTRUCTION AREA THROUGHOUT THE CONSTRUCTION PERIOD.
12. THE EXISTING ACCESS ROAD TO THE GOLF COURSE SHALL REMAIN UNTIL THE PRECAST CONCRETE ARCH BRIDGE HAS BEEN COMPLETED AND MAY BE USED TO REROUTE THE TRAFFIC. THE CONTRACTOR'S SCHEDULE SHALL INCLUDE TIME FRAMES FOR THE CONSTRUCTION OF THE BRIDGE, AND FOR THE CONSTRUCTION OF THE DIVERSION STRUCTURE AFTER COMPLETION OF THE BRIDGE.
13. UTILITY COORDINATION ON NELLIS AIR FORCE BASE CALL 652-4246.

REGISTERED PROFESSIONAL ENGINEER — STATE OF NEVADA — DAVID W. DAVIS — CIVIL — 1/20/93

Avoid cutting underground utility lines. It's costly.

GENERAL NOTES

1. PRIOR TO BEGINNING EXCAVATION VERIFY LOCATIONS OF EXISTING AND NEW UNDERGROUND UTILITIES, PIPING, ETC.. PROVIDE EXCAVATION, BACKFILL, SUPPORTS, SAWCUTTING, PATCHING, PAVING AS REQUIRED. BACKFILL EXCAVATIONS TO 90% COMPACTION AND PATCH TO MATCH EXISTING CONDITIONS.
2. ELECTRICAL SYSTEM OUTAGES SHALL BE PERMITTED ONLY AT TIMES APPROVED BY NELLIS AFB REPRESENTATIVE IN WRITING. WORK WHICH MAY RESULT IN AN ACCIDENTAL OUTAGE SHALL BE PREFORMED WITH NELLIS AFB REPRESENTATIVE ADVISED OF SUCH WORK.
3. COMMUNICATIONS SYSTEMS SHALL REMAIN IN OPERATION CONTINUOUSLY DURING CONSTRUCTION. CONTRACTOR SHALL PROVIDE TEMPORARY FACILITIES AS REQUIRED TO MAINTAIN SERVICE. COORDINATE ALL SUCH WORK WITH NELLIS AFB REPRESENTATIVE.
4. ALL DIRT AND DEBRIS SHALL BE REMOVED FROM ALL MANHOLES. DISPOSE OF AS DIRECTED BY CC PUBLIC WORKS.
5. DO NOT SCALE DRAWINGS. VERIFY DIMENSIONS IN FIELD PRIOR TO BEGINNING WORK.
6. CONTRACTOR SHALL VISIT JOB SITE PRIOR TO BID AND VERIFY THAT CONDITIONS ARE AS INDICATED. CONTRACTOR SHALL INCLUDE IN HIS BID COST REQUIRED TO MAKE HIS WORK MEET EXISTING CONDITIONS.
7. CONTRACTOR SHALL BE RESPONSIBLE TO GROUND EACH CABLE SHIELD, LOAD BREAK MODULES, ETC. TO GROUND ROD IN EACH MANHOLE.

638.01	DUST CONTROL SOIL STABALIZER	215	AC

GENERAL NOTES

1. THE INTENT OF THIS PROJECT IS TO CONSTRUCT VARIOUS FLOOD CONTROL IMPROVEMENTS WITHIN CLARK COUNTY. IMPROVEMENTS CONSIST OF A DIVERSION STRUCTURE; A DETENTION BASIN WITH OUTLET AND SPILLWAY STRUCTURES; AND AN OUTFALL CHANNEL FROM THE DETENTION BASIN.
2. ALL CONSTRUCTION SHALL BE IN ACCORDANCE WITH THE "IMPROVEMENT STANDARDS", MAY 1990, AS REVISED AND "UNIFORM STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION", 1986, CLARK COUNTY, NEVADA, UNLESS OTHERWISE SPECIFIED BY NOTE ON PLANS AND SPECIAL PROVISIONS OR AS DIRECTED BY THE ENGINEER. THE CONTRACTOR SHALL MAINTAIN A SET OF THESE STANDARDS AT THE JOBSITE AT ALL TIMES. COPIES MAY BE OBTAINED AT REGIONAL TRANSPORTATION COMMISSION. NOTE CHANGES IN CURING COMPOUND SECTION.
3. ALL UTILITY COMPANIES SHALL BE NOTIFIED AT LEAST 48 HOURS PRIOR TO BEGINNING CONSTRUCTION.
4. THE EXISTENCE AND LOCATION OF UNDERGROUND UTILITY PIPES OR STRUCTURES SHOWN ON PLANS FOR CONTRACTOR'S CONVENIENCE WERE OBTAINED BY A SEARCH OF AVAILABLE RECORDS. THE OWNER ASSUMES NO RESPONSIBILITY FOR UTILITIES OR STRUCTURES NOT OF RECORD, OR NOT IN THE LOCATION OF RECORD. THE CONTRACTOR'S LIABILITY REGARDING ANY DAMAGED UTILITY IS SET FORTH IN SECTION 105 OF THE STANDARD SPECIFICATIONS AND SPECIAL PROVISIONS. DETERMINE POSITIVE LOCATION OF ALL UTILITIES EARLY IN PROJECT.
5. THE CONTRACTOR SHALL, AT HIS OWN EXPENSE, LOCATE ALL OVERHEAD INTERFERENCES WHICH MAY AFFECT HIS OPERATION DURING CONSTRUCTION AND SHALL TAKE ALL NECESSARY PRECAUTIONS TO AVOID DAMAGE TO SAME. THE CONTRACTOR SHALL USE EXTREME CAUTION WHEN WORKING NEAR OVERHEAD OR UNDERGROUND POWER, GAS AND/OR OTHER UTILITIES SO AS TO SAFELY PROTECT ALL PERSONNEL AND EQUIPMENT, AND SHALL BE RESPONSIBLE FOR ALL COSTS AND LIABILITY IN CONNECT THEREWITH.
6. THE CONTRACTOR IS REQUIRED TO TAKE PRECAUTIONARY MEASURES TO PROTECT ALL EXISTING IMPROVEMENTS REMAINING IN PLACE, AND ANY IMPROVEMENTS OR STRUCTURES DAMAGED BY THE CONTRACTOR SHALL BE REPAIRED OR RECONSTRUCTED AT THE EXPENSE OF THE CONTRACTOR.
7. THE CONTRACTOR SHALL TAKE ALL PRECAUTIONS NECESSARY TO PROTECT EXISTING PERMANENT SURVEY MONUMENTS. ANY MONUMENTS DISTURBED SHALL BE REPLACED AND ADJUSTED, AT THE EXPENSE OF THE CONTRACTOR, PER AVAILABLE RECORDS IN ACCORDANCE WITH NEVADA REVISED STATUTE NUMBER 625.550.
8. ALL BARRICADING AND TEMPORARY TRAFFIC CONTROL DEVISES OR METHODS TO BE USED DURING CONSTRUCTION SHALL BE DONE IN ACCORDANCE WITH THE STATE OF NEVADA "TRAFFIC CONTROL MANUAL", LATEST EDITION, AND WITH THE "U.S. MANUAL ON UNIFORM TRAFFIC CONTROL DEVISES", LATEST EDITION, 1988.

DETENTION BASIN DATA

DRAINAGE AREA: 82.4 SQUARE MILES

DESIGN STORMS:
- MAJOR STORM:
  - PROBABILITY: 100-YEAR RECURRENCE INTERVAL
  - DURATION: 6 HOURS
  - RAINFALL DISTRIBUTION: SCS #5
  - DEPTH AREA REDUCTION FACTOR: 0.63
  - POINT PRECIPITATION: 3.15 TO 2.86 INCHES
  - PEAK INFLOW: 4,580 CFS
  - PEAK BYPASSED FLOW: 1,400 CFS
  - VOLUME OF INFLOW HYDROGRAPH: 1,555 ACRE-FT
- PROBABLE MAXIMUM FLOOD:
  - TRIBUTARY AREA: 53.3 SQUARE MILES
  - AREAL REDUCED PMP: 10.0 INCHES
  - PEAK INFLOW: 74,000 CFS
  - VOLUME OF INFLOW HYDROGRAPH: 20,600 ACRE-FT

DETENTION BASIN EMBANKMENT:
- TYPE: HOMOGENEOUS EARTHFILL
- LENGTH: 1,800 FEET
- MAXIMUM HEIGHT ABOVE EXISTING GRADE: 13.5 FEET
- CREST ELEVATION: 1821.5
- FREEBOARD:
  - MAJOR STORM: 5.6 FEET
  - PROBABLE MAXIMUM FLOOD: 0.6 FEET
- SLOPES:
  - UPSTREAM SLOPE: 4:1 HORIZONTAL TO VERTICAL
  - DOWNSTREAM SLOPE: 4:1 HORIZONTAL TO VERTICAL

IMPOUNDMENT AREA:
- MAJOR STORM:
  - WATER SURFACE ELEVATION: 1815.9
  - SURFACE AREA: 157 ACRES
  - STORAGE VOLUME: 1,025 ACRE-FT
- PROBABLE MAXIMUM FLOOD:
  - WATER SURFACE ELEVATION: 1820.9
  - SURFACE AREA: 209 ACRES
  - STORAGE VOLUME: 1920 ACRE-FT

SPILLWAY:
- TYPE: UNCONTROLLED FREE OVERFALL SOIL CEMENT
- CREST ELEVATION: 1816.0
- CREST LENGTH: 2,200 FEET
- SLOPE: 2:1 HORIZONTAL TO VERTICAL
- MAXIMUM DROP: 8 FEET
- DISCHARGE MAJOR STORM: 0.0 CFS
- DISCHARGE PROBABLE MAXIMUM FLOOD: 71,300 CFS

OUTLET WORKS: UNCONTROLLED TWO LEVEL OUTLET
- LOW LEVEL OUTLET:
  - TYPE: SQUARE EDGE ORIFICE WITH TRASH RACK
  - ORIFICE: 5'-6" X 4'-0"
  - INVERT ELEVATION: 1798.8
- HIGH LEVEL OUTLET:
  - TYPE: UNCONTROLLED WEIR
  - WEIR CREST ELEVATION: 1813.0
  - WEIR LENGTH: 114 FEET
- OUTLET PIPE: DOUBLE 8'X 7' RCB CULVERTS
- PEAK DISCHARGE MAJOR STORM: 1,820 CFS
- PEAK DISCHARGE PROBABLE MAXIMUM FLOOD: 2,600 CFS

I, Richard L. Montague, registered Professional Land Surveyor, do hereby certify that this map correctly delineates the results of an actual survey made by me and/or under my supervision, and is located in Section 9, 10, 15 and 16, Township 20 South, Range 62 East, M.D.M., Clark County, Nevada. This survey was performed to establish the legal rights-of-way and/or boundary limits for Sloan Channel improvements, Confluence Detention Basin and appurtenant collection and discharge facilities.

CONSTRUCTION NOTES

1. MATCH EXISTING CONCRETE CHANNEL PER DETAIL (2/C-11)
2. CONSTRUCT 6' HIGH CHAIN LINK FENCE PER N.D.O.T. STD. DWG. NO. R-6.1.1.-R(724)
3. CONSTRUCT CHANNEL SURFACE INLET FENCE (1/C-13)
4. CONSTRUCT FENCE GATE PER N.D.O.T. STD. DWG. NO. R-6.3.3.-(616)
5. PROTECT EXISTING CURB AND GUTTER, STREET LIGHTING, LANDSCAPING, AND SPRINKLER SYSTEM.
6. CONSTRUCT PIPE CONNECTION PER DETAIL (10/C-12)
7. CONSTRUCT SLOPE PAVING (9/C-11)
8. ADJUST EXISTING MANHOLE COVER AND FRAME. (STD. DWG. NO. 308)
9. CONSTRUCT CHANNEL ACCESS STEPS (3/C-12)
10. CONSTRUCT 60' COMMERCIAL DRIVEWAY PER STD. DWG. 117A
11. CONSTRUCT PERMANENT SIGN

GENERAL NOTES

1. CONTRACTOR SHALL PROVIDE ALL NECESSARY HORIZONTAL AND VERTICAL TRANSITIONS BETWEEN NEW CONSTRUCTION AND EXISTING SURFACES TO PROVIDE FOR PROPER DRAINAGE AND OF INGRESS AND EGRESS TO SAID CONSTRUCTION, EXTENT OF TRANSITION, TO BE DETERMINED BY THE COUNTY AND AS SHOWN ON PLANS.
2. EXISTING UTILITIES ARE LOCATED ON THE PLANS FOR THE CONVENIENCE OF THE CONTRACTOR ONLY. THE CONTRACTOR SHALL BEAR FULL RESPONSIBILITY FOR THE PROTECTION OF UTILITIES AND THE ENGINEER BEARS NO RESPONSIBILITY FOR UTILITIES NOT SHOWN ON THE PLANS OR NOT IN THE LOCATION SHOWN ON THE PLANS. (CALL BEFORE YOU DIG 1-800-227-2600)
3. ALL CONSTRUCTION AND MATERIALS FOR THIS PROJECT SHALL BE IN ACCORDANCE WITH THE MOST RECENT EDITION OF THE UNIFORM STANDARD DRAWINGS AND SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION OFF-SITE IMPROVEMENTS, CLARK COUNTY AREA, NEVADA.
4. ALL UTILITY COMPANIES SHALL BE NOTIFIED BY THE CONTRACTOR AT LEAST 48 (FORTY EIGHT) HOURS PRIOR TO COMMENCEMENT OF CONSTRUCTION.
5. CONTRACTOR SHALL BE RESPONSIBLE FOR THE VERTICAL ADJUSTMENT OF ALL EXISTING MANHOLES TO THE FINAL GRADES IN ACCORDANCE WITH SECTION 609 OF THE "STANDARD SPECIFICATIONS", UNLESS NOTIFIED OTHERWISE BY THE ENGINEER.
6. THE CONTRACTOR(S) SHALL NOT START WORK WITHIN THE ROAD RIGHTS-OF-WAY UNTIL THE CONSTRUCTION TRAFFIC PLAN SUBMITTED BY THE CONTRACTOR(S) IS APPROVED BY THE COUNTY.
7. ALL CONCRETE SHALL BE IN ACCORDANCE WITH THE REQUIREMENTS AS INDICATED IN THE STRUCTURAL NOTES FOR THIS PROJECT.
8. ALL BARRICADING AND TEMPORARY TRAFFIC CONTROL DEVICES OR METHODS USED DURING CONSTRUCTION SHALL BE IN ACCORDANCE WITH THE "NEVADA WORK ZONE TRAFFIC CONTROL HANDBOOK, 1985", PUBLISHED BY THE STATE OF NEVADA, DEPARTMENT OF HIGHWAYS, EXCEPT AS OTHERWISE PROVIDED IN THE CONTRACT SPECIFICATIONS OR REQUIRED BY THE ENGINEER.
9. ALL STATIONS ARE CENTERLINE STATIONS UNLESS NOTED ON THE DRAWINGS.
10. THE CONTRACTOR SHALL TAKE ALL PRECAUTIONARY MEASURES NECESSARY TO PROTECT EXISTING IMPROVEMENTS WHICH ARE TO REMAIN IN PLACE, FROM DAMAGE, AND ALL SUCH IMPROVEMENTS OR STRUCTURES DAMAGED BY THE CONTRACTOR'S OPERATIONS SHALL BE REPAIRED OR RECONSTRUCTED SATISFACTORY TO THE COUNTY OR UTILITY COMPANY AT THE EXPENSE OF THE CONTRACTOR.
11. ALL CONSTRUCTION SHALL BE AS SHOWN ON THESE PLANS, ANY ALTERATIONS SHALL HAVE THE PRIOR WRITTEN APPROVAL OF THE COUNTY.
12. THE CONTRACTOR SHALL, AT HIS OWN EXPENSE, LOCATE ALL OVERHEAD INTERFERENCES WHICH MAY AFFECT HIS OPERATION DURING CONSTRUCTION AND SHALL TAKE ALL NECESSARY PRECAUTIONS TO AVOID DAMAGE TO SAME. THE CONTRACTOR SHALL USE EXTREME CAUTION WHEN WORKING NEAR OVERHEAD OR UNDERGROUND POWER AND/OR TELEPHONE FACILITIES SO AS TO SAFELY PROTECT ALL PERSONNEL AND EQUIPMENT, AND SHALL BE RESPONSIBLE FOR ALL COSTS AND LIABILITY IN CONNECTION THEREWITH.
13. PERMITS ARE REQUIRED FOR ANY WORK IN THE PUBLIC RIGHT-OF-WAY. THE CONTRACTOR SHALL SECURE ALL PERMITS AND INSPECTIONS REQUIRED FOR THIS CONSTRUCTION.
14. THE CONTRACTOR SHALL TAKE ALL PRECAUTIONS NECESSARY TO PROTECT EXISTING PERMANENT SURVEY MONUMENTS. ALL MONUMENTS DISTURBED SHALL BE REPLACED AND ADJUSTED PER AVAILABLE RECORDS IN ACCORDANCE WITH N.R.S. STATUTE NO. 625.550.
15. THESE PLANS SHALL BE ON THE JOBSITE AT ALL TIMES.
16. CAUTION:

    THE CONTRACTOR SHALL EXERCISE EXTREME CAUTION WHEN EXCAVATING ALONG EXISTING C.M.U. WALLS IN ORDER TO PREVENT UNDERMINING OF EXISTING WALL FOOTINGS. TOP OF FOOTING ELEVATIONS FOR THE EXISTING CMU WALLS SHOWN ON THE PLANS ARE FOR REFERENCE ONLY AND SHOULD BE VERIFIED BY THE CONTRACTOR PRIOR TO EXCAVATION NEAR EXISTING WALLS.

BASIS OF BEARINGS

NORTH 00°18'40" WEST BEING THE WEST LINE OF THE SOUTHWEST QUARTER (SW 1/4) OF SECTION 3, TOWNSHIP 21 SOUTH, RANGE 62 EAST, M.D.M. AS SHOWN BY A MAP THEREOF ON FILE IN BOOK 50, PAGE 65 OF PLATS IN THE CLARK COUNTY RECORDER'S OFFICE, CLARK COUNTY, NEVADA.

BENCHMARK

CLARK COUNTY BENCHMARK STATION 7C02 21SES BEING A RIVET IN 2"x 2" ALUMINUM PLATE IN TOP CURB, NORTH SIDE OF OWENS AVENUE AND WEST OF SLOAN CHANNEL.
ELEVATION: 1780.25 FEET.

RESPONSE MEMORANDUM

REGARDING FEMA CONCERNS ON WEST RANGE WASH DIVERSION DIKE

Case No. 96-09-43P

October 18, 1997

RESPONSE MEMORANDUM

REGARDING FEMA CONCERNS ON WEST RANGE WASH DIVERSION DIKE

This memorandum was prepared in response to the letter from Federal Emergency Management Agency (FEMA) dated September 5, 1996 regarding the Range Wash Flood Insurance Study Restudy, Case Number 96-09-483P. The letter expressed two areas of concern: (1) deposition where flows would impact the dike, and (2) possible erosion along the dike at the downstream end, stations 58+00 to 62+00, where there is an increase in slope and change in cross-section.

ITEM 1 DEPOSITION FROM FLOW PERPENDICULAR TO THE DIKE

The letter expresses concern that, as flows strike the dike, the velocity of flow will go to approximately zero as the flow changes direction and the accompanying sediment load will be deposited. The deposition at the dike will continue to build throughout the course of the storm hydrograph. There is concern that the sediment deposition at the dike may be high enough to allow flow to eventually overtop the dike.

Approach

An evaluation of sediment accumulation along the dike during a 100-year event was performed using a simplistic approach based on sediment loads already determined and included in the support documentation.

The previous analysis and documentation prepared by Boyle Engineering Corporation (Boyle) and included in the TSDN was reviewed. Review of topographic maps and field reconnaissance was performed to assist in making appropriate assumptions and selection of parameters. Factors to be considered for flow conditions at the dike included: type of flow regime, cumulative width of multiple channels, the spread of multiple channels, and the volume, shape, and slope of deposition accumulating as flows impact the dike.

An estimation of the deposition at the dike was determined and the conveyance along the dike was evaluated for appropriate freeboard.

Multiple Channel Flow Regime

The topography and basin boundaries tributary to the dike are shown in **Figure 1**. The topography is relevant in determining the type of flow regime. The Boyle analysis indicated that a multiple channel flow regime was expected at the location of the dike, but a single channel flow was assumed for the purpose of using a conservative approach to their analysis.

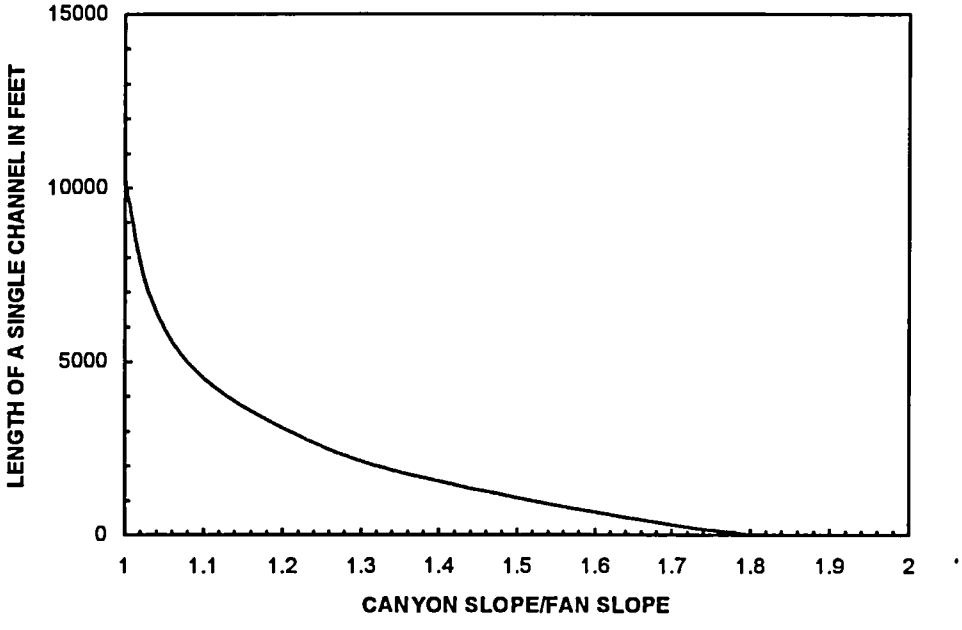
DIVERSION DIKE

Figure 2, from previous documentation, gives a length of a single channel regime based on the ratio of the canyon slope to the fan slope. The relationship indicates a maximum single channel length of approximately 10,000 feet.

From the topographic map it may be noted that there is not a narrow well defined canyon at the top of the West Range Wash Fan. The upper canyons are wide and filled with alluvium. Smaller fans occur upstream of the effectual apex of the West Range Fan. Several flow paths converge and form the effectual apex at the approximate location of contour 3400. This location is more than 4 miles (approximately 23,000 feet) upstream of the dike. Based on these factors it may be assumed that flows have reached a multiple channel regime upstream of the dike.

FIGURE 2
RELATIONSHIP BETWEEN LENGTH OF A SINGLE CHANNEL AND RATIO OF CANYON SLOPE TO FAN SLOPE



Canyon slope should normally be computed along the stream bed of the lower canyon to a point upstream of the canyon mouth where there is a notable change to a steeper gradient. Fan slope should normally be computed for the upper portion of the fan to a point downstream of the fan apex where there is a notable change to a flatter gradient.

Width of Flow

As included in the previous documentation the cumulative width of the multiple channel flow is estimated to be 1,254 feet. This is based on standard FEMA methodology using Dawdy's

Equations for flow regime and a 100-year peak discharge of 7,030 cfs. The width of flow is related to the quantity of flow by the following equation:

$$B = 36.1\ Q^{.4}$$

Where:

B = the cumulative width of flow in multiple channels in feet

Q = the discharge in cfs

Spread of Multiple Channels

The higher up the fan flows begin to divide, the wider the spread of flows would be at the dike. The wider the spread of flow, the more dispersed deposition along the dike would be. At the location of the dike the flow on the fan is assumed to be a multiple channel flow regime. Evidence was sought to aid in selecting a reasonable assumption for the spread of the flow reaching the dike. The width of the fan at the upstream end of the dike is approximately 5 miles wide (26,000 feet). The fan arc is very uniform with numerous small stream paths uniformly spread across the fan. The fan arc is very uniform extending up to approximate elevation 3300. At this elevation, the contours no longer follow the same arc pattern. Some incisement into the arc seems to have occurred typical of a single channel regime. A bifurcation point is therefore assumed between contours 3300 and 3200. See **Figure 3**. The bifurcation point represents a change from single channel regime to multiple channel regime.. The assumed bifurcation point, approximately 19,000 feet upstream of the dike, would support an assumption of widely spread flows reaching the dike.

A fan analysis to determine FEMA flood hazard zones was performed as an indication of the one percent probability of depths of flows reaching the dike. Flows for the 2, 5, 10, 25, 50, and 100-year recurrence intervals were used from the documentation prepared by Boyle. The analysis indicated that the dike, located at a fan width of 27,000 feet, is below the one foot depth zone. According to the analysis the 0.5 depth limit is located at a fan width of 25,805. This would also support that flows reaching the dike would likely be shallow and widely dispersed.

Field visits, analysis of topographic mapping, and aerial photos indicated that there are numerous narrow flow paths dissecting the fan. Major flooding occurred during a summer thunderstorm of July 28, 1984. In that storm 2.5 to 3.0 inches of rain fell over a large area including the Range Wash watershed. Since this storm approximated a 100-year event and had little impact on the pattern of numerous small flow paths, it is reasonable to assume the existing natural flow paths or similar new paths would occur in future flood events. The stream paths on the fan are distinct and separated by much older alluvium. Areas between recent flow paths exhibit desert pavement and desert varnish characteristics. See the included photographs.

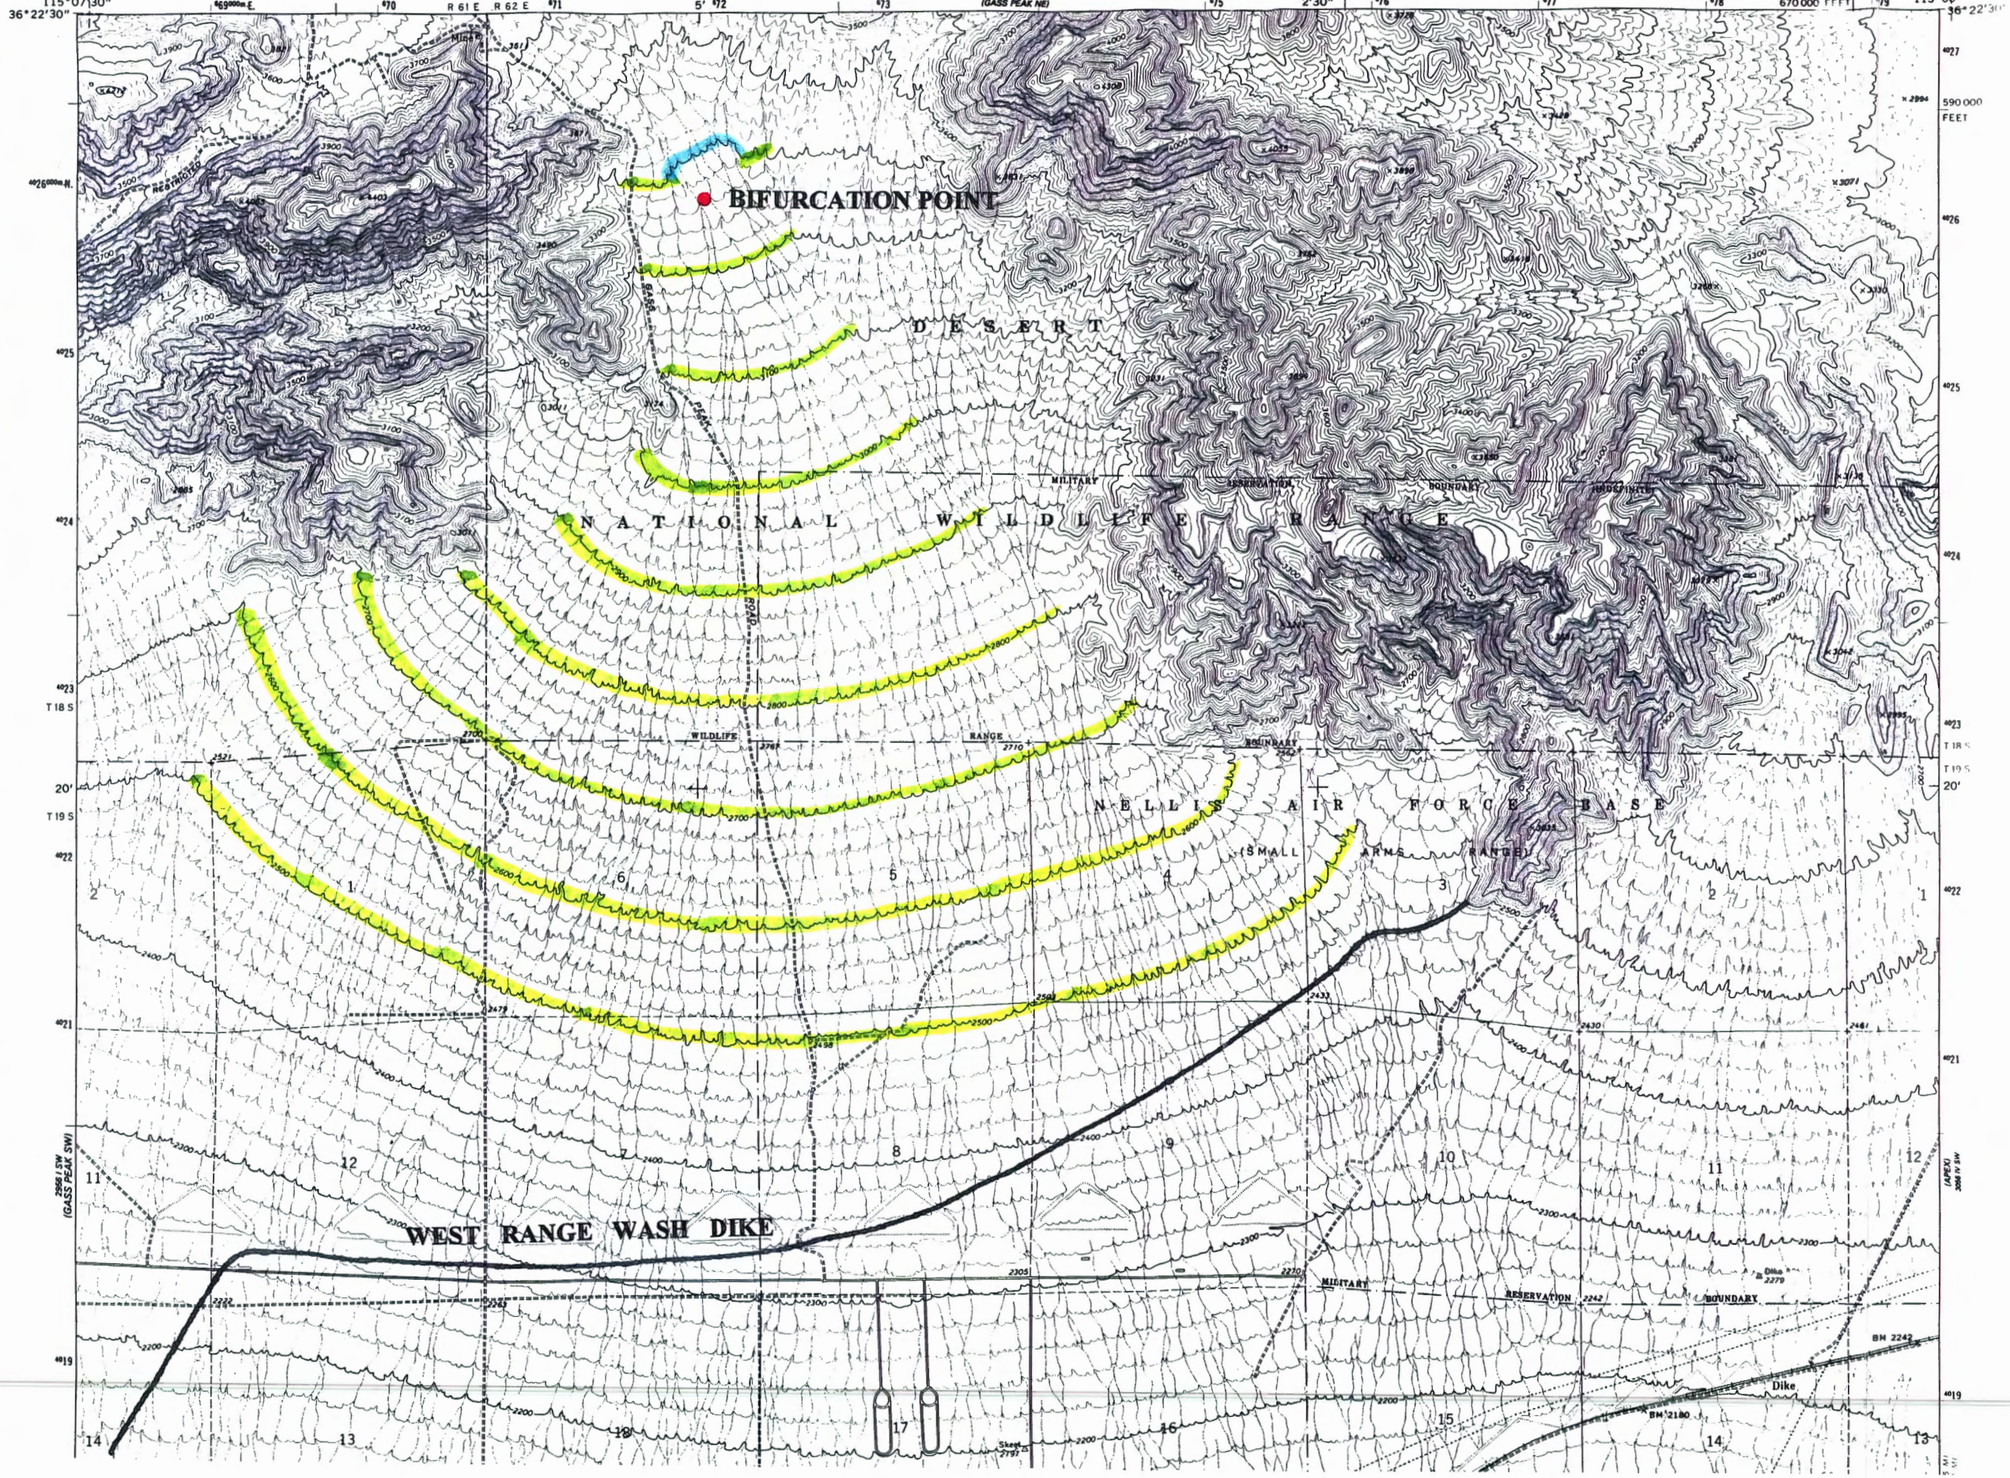

FIGURE 3

WEST RANGE FAN

Reduced Scale
1 inch = 3,000 feet

A representative reach along the dike was evaluated as an indication of the cumulative widths of flow paths related to the width of the fan at the dike. Along a 2,900 foot long reach of the dike (Plan Sheet D-7), the cumulative stream widths intercepted by the dike were estimated to total approximately 350 feet. Based on this estimate, the flow width to spread ratio along the dike would be 0.12. At this ratio, the flow would be spread in multiple channels across the fan for a width of 10,450 feet at the dike. This is approximately 40% of the total fan width at the dike. This seems reasonable based on the bifurcation point high on the fan as previously assumed. However, since these estimates were rough, and alluvial fan flows are very unpredictable, a more conservative ratio of 0.20 was assumed appropriate. At this ratio the spread of flow would be 6,270 feet, approximately 23% of the fan width at the dike. The width of the peak flow (1,254 feet) is 4.6% of the fan width at the dike.

Volume of Sediment

The previous documentation for the dike prepared by Boyle included a HEC-6 sediment transport analysis. The analysis included a determination of a stable transport capacity down the fan and a volume of sediment deposited in a transition reach from the fan to the dike. Boyle's calculations indicated 32.1 acre-ft of deposition occurred in the transition reach from fan to dike. It was estimated that 37% of the total (11.8 acre feet) was deposited at the time the peak flow occurred. The Boyle approach assumes that as deposition begins to occur at the dike, the deposition accumulation, and the dike, will cause the flow to turn and flow along the dike. Therefore a transition channel from fan to dike would form and there would not be a sudden loss of velocity and transport capacity during the peak flow.

In response to FEMA's request, this analysis will consider a complete loss of velocity and sediment transport capacity as flows meet the dike. Since the velocity is assumed to go to zero the total sand and gravel sediment load is assumed to be deposited. Since the flows will not be ponded for a long period of time, the fine materials are assumed to remain in suspension. Based on the Boyle HEC-6 analysis for fan capacity, the sediment loads, and assumed volume of deposition are given in **Table 1**.

Table 1
100-Year Event Sediment Loads and Deposition

Time (min)	Discharge (cfs)	Silt Inflow (Tons/Day)	Sand Inflow (Tons/Day)	Total Sediment Inflow (Tons/Day)	Deposition (total sand inflow) (Tons)	Cumulative Deposition (Tons)	Cumulative Deposition (Acre-ft)
145	0.0	0.0	0.0	0.0	0.0	0.0	0.0
205	261	11,262	20,656	31,918	430	430	0.2
265	2,742	383,494	417,442	800,936	9,127	9,557	4.7
325	7,028	1,573,639	1,097,033	2,670,672	31,552	41,109	20.3
385	5,897	1,209,496	852,337	2,061,833	40,612	81,721	40.3
445	2,172	270,363	221,785	492,148	22,378	104,098	51.4
505	516	31,306	30,673	61,979	5,260	109,358	54.0
565	142	4,520	3,230	7,750	706	110,064	54.3

The sediment capacity of the fan flow was based on a single channel flow regime. The multiple channel flow regime would transport less sediment to the dike. Nevertheless, the sediment capacity determined by Boyle will be used for this evaluation as a conservative approach.

The estimated sediment deposition volume would not be deposited in one place based on a multiple channel assumption. In the course of the storm event, the width, and spread, and number, of active channels reaching the dike would change. As a conservative assumption a stream path was presumed to continuously deposit sediment at one location throughout the storm event. To determine the amount of deposition possible from a continuously flowing single stream path the discharge and sediment load per unit width of flow was determined as given in **Table 2**:

Table 2
Flow and Deposition Per Unit Width of Channel

Time (min)	Discharge (cfs)	Cum. Multiple Channel Width (ft)	Unit Discharge (cfs/ft)	Deposition (Tons)	Deposition Per Channel Width (Tons/ft)
145	0	0	0	0	0
205	261	334	0.78	430	1.29
265	2,742	857	3.20	9,127	10.66
325	7,028	1,248	5.63	31,552	25.28
385	5,897	1,163	5.07	40,612	34.91
445	2,172	780	2.78	22,378	28.68
505	516	439	1.18	5,260	11.98
565	142	262	0.54	706	2.70

The existing stream paths at the dike are typically narrow, less than 10 feet wide. The largest observed active/recent flow path was approximately 30 feet wide. As a conservative assumption, a stream 50 feet wide was used for the basis of the analysis. Based on the width to spread ratio of 0.20, a flow width of 50 feet would have a spread of influence 250 feet wide. The volume of deposition would be the same, but it would be slightly more dispersed, if 5 channels 10 feet wide were considered along a 250 foot reach of the dike. The volume of sediment conveyed to the dike in a 50 foot wide channel assumed to flow continuously the entire duration of the storm is given in the **Table 3.**

Table 3
Deposition From 50 Foot Wide Channel

Time (min)	Width (ft)	Unit Discharge (cfs/ft)	Discharge (cfs)	Deposition Per Channel Width (Tons/ft)	Deposition (Tons)	Cumulative Deposition (Tons)	Cumulative Deposition (Acre-ft)
145	50	0	0	0	0	0	0
205	50	0.78	39	1.29	64	64	0.03
265	50	3.20	160	10.66	533	597	0.29
325	50	5.63	282	25.28	1,264	1,861	0.92
385	50	5.07	253	34.91	1,745	3,606	1.78
445	50	2.78	139	28.68	1,434	5,040	2.49
505	50	1.18	59	11.98	599	5,639	2.78
565	50	0.54	27	2.70	135	5,774	2.85

The channel on the upstream side of the dike has a 120 foot wide base width. The upstream slope of the dike is 4:1 horizontal to vertical. The cut slope of the channel opposite the dike embankment is at 3:1. As flows come down the fan and drop into the channel, down the 3:1 slope, some localized erosion and deposition will occur. It is assumed the drop into the channel will cause head cutting up the stream path. The materials scoured by head cutting will be deposited and form a sediment cone to build in the channel. See the included photographs for evidence of localized erosion and deposition. The sediment cone and head cutting are assumed to stop and be stabilized when the slope of the cone is equal to the slope of the fan (4%). The height of the cone for the localized condition is assumed to be five feet. **Figure 4** is a rendering of a debris cone in the channel. The radius of the cone is assumed to be 125 feet. This pattern is assumed to be repeated along the reach of the dike every 250 feet. The actual conditions would likely be less severe.

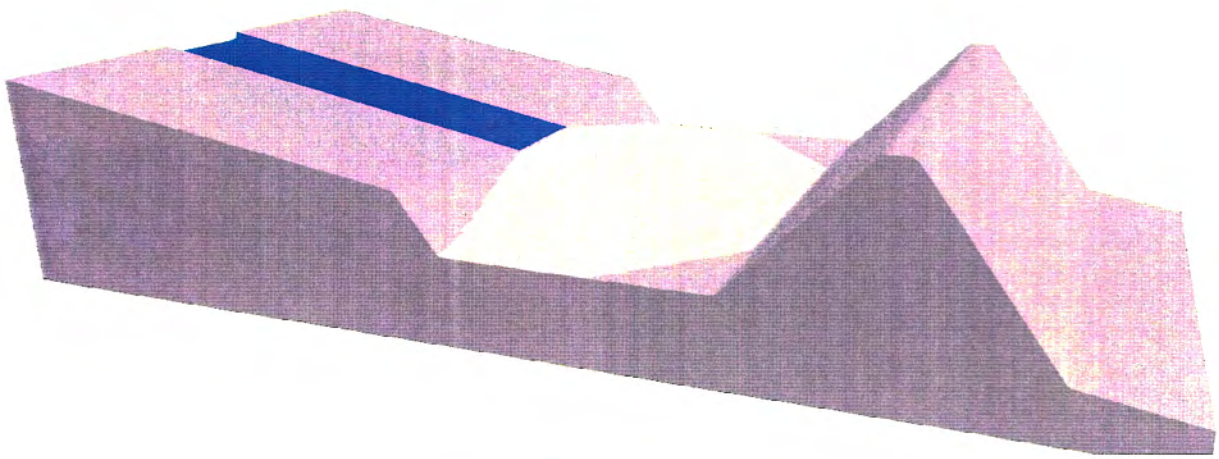

FIGURE 4 Sediment Cone From Localized Erosion

The volume of the sediment deposition from the localized condition is estimated by taking half the volume of a circular cone with a 125 foot radius and height of 5 feet. The estimated volume is 0.94 acre-feet.

The sediment cone from localized erosion would build gradually, but for simplicity this volume is added to each of the amounts of sediment estimated to be transported down the fan at different time increments in the hydrograph. Therefore, the volume of sediment deposited at the dike is assumed to be the volume of the sand transported down the fan based on the HEC-6 analysis, plus the 0.94 acre-ft estimated for local scour and deposition.

As more sediment accumulates at the dike it is assumed the slope of the cone will become flatter. The cone is assumed to eventually reach a slope of 2%. This slope is half the natural slope and is based on the assumption commonly used to estimate debris volume in a debris basin. This slope assumption is used by the U.S. Army Corps of Engineers and is prescribed in the *Los Angeles County Flood Control District Design Manual Debris Dams and Basins.* The manual states:

> The calculation for the debris volume shall be based on the assumption that the debris will be deposited in such a manner that the debris slope, sloping upstream from the spillway crest, will be equal to 50 per cent of the average slope of the original stream bed for the total length of the basin site.

The volume of sediment from a 50 foot wide channel is assumed to be deposited in a 250 foot long reach along the dike. As the sediment volume increases, it is assumed to transition from a cone with a 4% slope, to a cone with a 2% slope, to filling the channel and sloping back on a 2% slope. Trial and error solutions were performed to estimate the height and slope of deposition at different time increments of the storm. The results are shown in **Table 4** and the accompanying definition sketch.

A normal depth calculation was performed based on the cross-section filled with sediment as estimated above. The channel along the dike is assumed to be filled with sediment to a level of 4.3 feet and slope back on a 2% slope. The depth of flow was 5.59 feet leaving a freeboard of 5.41 feet. The height of the dike above the energy line is 4.12 feet, thus there is more than 3 feet of freeboard as required. The conditions of the normal depth calculation are a conservative assumption since at the upstream end of the dike there would be less flow. At the downstream end of the dike, the flow would increase to the peak flow rate of 7,030 cfs, but the deposition in the channel would be less. During the peak flow the multiple channel width is 1,254 feet. This would be approximately equivalent to 25 channels 50 feet wide. If each of the channels deposited 3.79 acre-ft of sediment the total deposited would be 94.75 acre-ft. However, all the channels would not flow continuously throughout the storm hydrograph. As flows accumulate in the channel along the dike the velocity and sediment transport capacity along the dike would increase, therefore there would be less deposition at the downstream end of the dike.

ITEM 2 EROSION PROTECTION STATIONS 58+00 TO 62+00

The FEMA letter requests information about erosion protection on the left bank (looking downstream) from stations 58+00 to 62+00. This is the location where the dike turns and transitions to the floodway in to the North Las Vegas Detention Basin. The slope of the channel along the dike increased from 0.8% to 2.1%.

The embankment is presently not lined along this reach. The channel along the dike is below grade approximately 5 to 7 feet. Since the channel is below grade, and the higher energy of the channel would cause degradation of the bed, it may be argued that flows would continue to be confined even if erosion occurred. It may also be noted that the dike is on the inside of the curve. Channel bends have characteristics of scour on the outer side of a curve and deposition on the inner side of a curve. Scour on the outer side of the bend would not jeopardize the containment of flow.

A HEC-RAS water surface profile analysis was performed for this reach. It indicated depths between 4.1 and 2.4 feet and velocities between 12.7 and 17.3 fps. The shear stress for the steeper reach was compared to the shear stress along the normal channel dike reach which is assumed to be in equilibrium. Shear stress is given by the following equation:

$$\tau = \gamma y S$$

where:

τ = shear stress (lbs/ft^2)

γ = unit weight of water (62.4 lb/ft^3)

y = depth of flow (ft)

S = Slope (ft/ft)

Therefore the shear stress along the dike is:

$$\tau = (62.4)\,(4.12)\,(.008) = 2.05$$

The shear stress for the transitional area is:

$$\tau = (62.4)\,(2.89)\,(.0228) = 4.11$$

Since the shear stress approximately doubles, there is a significant difference in the channel equilibrium and scour would occur. For this reason Post, Buckley, Schuh & Jernigan, Inc. recommends that erosion protection along this reach of the dike be provided. Although the

channel is below grade, the downward gradient of the fan could cause flows to eventually escape if significant erosion of the dike occurs.

It is recommended that the dike be soil cement lined, similarly to the floodway (Section B Drawing DT-1), for the reach from station 55+00 to 62+00.

CONCLUSION

Post, Buckley, Schuh & Jernigan, Inc. recommends that the dike be accepted by FEMA based on the sediment accumulation analysis demonstrating sufficient freeboard, and on condition that the reach from 55+00 to 62+00 is lined with soil cement.

RESPONSE MEMORANDUM

REGARDING FEMA CONCERNS ON
RANGE WASH ~~CONFLUENCE DB~~
FLOOD INSURANCE STUDY RESTUDY

484R

Case No. 96-09-~~48R~~

~~CLOMR DATED SEPT 19, 1996~~

January 22, 1997

RESPONSE MEMORANDUM

REGARDING FEMA CONCERNS ON RANGE WASH FLOOD INSURANCE STUDY RESTUDY

Introduction

This memorandum was prepared in response to the letter from Federal Emergency Management Agency (FEMA) dated September 19, 1996 regarding the Range Wash Flood Insurance Study Restudy, Case Number 96-09-484R. The restudy is based on proposed construction of the Range Wash/~~Sloan Channel~~ Confluence Detention Basin (~~Confluence Detention Basin~~) and channel modifications along the Sloan Channel.
RW CDB

West Range Wash Dike

The September 19th letter indicates issues regarding the West Range Wash Diversion Dike must be resolved. A memorandum dated November 19, 1996, was prepared in response to a letter from FEMA dated September 5, 1996 regarding the West Range Wash Diversion Dike. A LETTER OF MAP REVISION WAS SUBSEQUENTLY ISSUED ON JANUARY 28, 1997 UNDER CASE NO. 96-09-043P

Nellis Boulevard Storm Drain

The September 19th letter requested information to demonstrate that flows are intercepted by Nellis Boulevard and conveyed to the Las Vegas Wash. Additional hydrology was performed for the area contributing to the Nellis Boulevard Storm Drain System. The additional subbasins are shown in **Figure 1**. Additional soils information is show in **Figure 2**. The current land use for the added area is shown in **Figure 3.** Hydrologic calculations are included in the **Appendix A**. **Appendix B** includes hydraulic calculations for the inlets, storm drain and street capacities. **Exhibit F**, bound separately, contains the plans for the Nellis Boulevard Storm Drain. The capacities and 100-year flows are summarized in **Table 1.** According to the calculated flows and capacities, Nellis Boulevard and its storm drain system will intercept the flows and act as a basin boundary to the Range Wash Basin.

Table 1
Summary Nellis Boulevard Capacity

Location	Street Capacity (cfs)	Pipe Capacity (cfs)	Total Capacity (cfs)	Estimated 100-Year Flow (cfs)
Nellis at Carey	181	259	440	426
Nellis at Owens	95	439	534	489
Nellis at Bonanza	67	520	587	536

Confluence Detention Basin Outlet Structure Buoyancy

The letter expressed concern about the buoyant force on the outlet works of the detention basin jeopardizing its proper function. An analysis of the existing structure indicated the Factor of Safety was less than one. To increase the Factor of Safety, against the buoyant force on the outlet structure, mitigation is proposed by the installation of gabions in the structure. The proposed mitigation is shown in **Figure 4.** The gabions will add weight to the structure and have a minimal effect on the hydraulics of the outlet structure. The gabions do not obstruct the low level orifice or the 2-8'x7' Reinforced Concrete Boxes leaving the structure. The gabions increase the depth in the structure and slightly reduce the capacity of the low level orifice. At a water surface level of 1813.00, equal to the high level weir crest, the low level orifice capacity is reduced from 367 cfs to 362 cfs. The overall impact of the change in the stage-storage-discharge increased the maximum stage by 0.01 feet, from 1815.90 to 1815.91, which is still below the emergency spillway crest of 1816.00. The hydraulic calculations for the outlet structure mitigated with gabions are included in **Appendix C**. A HEC-1 output for the Confluence Detention Basin with the slightly revised stage-storage-discharge relationship is included in **Appendix D**.

Calculations for the buoyancy of the structure are included in **Appendix E**. The calculations indicate the gabions increase the Factor of Safety to 1.2.

Sloan Channel

The FEMA letter indicates concern about velocities and erosion in the unlined portion of Sloan Channel Downstream of Stewart Avenue. Since the reach of channel between Stewart Avenue and Charleston Boulevard is designed and will be constructed shortly, map changes based on a Conditional Letter of Map Revision (CLOMR) are proposed for this reach of the channel. The 95% Plans for the channel are included as a separate attachment as **Exhibit G.** Revisions to the map downstream of Charleston Boulevard will not be proposed at this time.

Additional Submittal Items

The proposed revisions to the FIRMs due to the Confluence Detention Basin and Sloan Channel Improvements are shown in **Figure 5**. When final as-built plans of the proposed Sloan Channel improvements are available they will be submitted. The following items are resubmitted as requested:

- Annotated FIRM showing the SFHA associated with Confluence Detention Basin and Sloan Channel improvements (**Figure 5**)
- FEMA Forms 1 through 7 (**Appendix F**).
- As-built plans of the Confluence Detention Basin (**Exhibit H**).
- Officially adopted maintenance and operation plan for the Confluence Detention Basin and Sloan Channel (See **Appendix G**).

Conclusion

Post, Buckley, Schuh & Jernigan, Inc. recommends that the FIRMs be modified as shown in **Figure 5**, after mitigation to the Confluence Detention Basin Outlet Structure as shown in **Figure 4**, and construction of the Sloan Channel from Stewart Avenue to Charleston Boulevard as indicated in **Exhibit G.**

APPENDIX A

HYDROLOGIC CALCULATIONS
NELLIS STORM DRAIN AREA

RANGE WASH FLOOD INSURANCE RESTUDY

TABLE A6-A

DRAINAGE BASIN LAG TIME CALCULATIONS

Per CCRFCD Hydrologic Criteria and Drainage Design Manual, Section 606.3

For drainage basins with areas greater than one square mile.

$$\text{(USBR) } T_{lag} = 20*K_n(L*L_c/S^{0.5})^{0.33}$$

Basin Name	Roughness Type	Manning's Roughness (K_n)	Reach Length (L) (Feet)	Reach Length (L) (Miles)	Centroid Length (L_c) (Miles)	Average Slope (Ft/Ft)	Average Slope (S) (Feet/Mile)	(USBR) Lag Time (T_{lag}) (Hours)
321A	Mtn-Braid	0.050	11500	2.178	1.089	0.005	26	0.77

HYDROLOGIC CRITERIA AND DRAINAGE DESIGN MANUAL

TIME OF CONCENTRATION

TABLE A5.2-A

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

Nellis at Carey - Street Capactiy
Worksheet for Irregular Channel

Project Description	
Project File	c:\haestad\fmw\nellis.fm2
Worksheet	Nellis Blvd at Carey
Flow Element	Irregular Channel
Method	Manning's Formula
Solve For	Discharge

Input Data		
Channel Slope	0.004800	ft/ft
Water Surface Elevation	1.53	ft

Elevation range: 0.50 ft to 2.00 ft.

Station (ft)	Elevation (ft)	Start Station	End Station	Roughness
0.00	2.00	0.00	189.00	0.016
50.00	1.00			
50.00	0.50			
51.50	0.63			
51.50	0.67			
94.50	1.53			
137.50	0.67			
137.50	0.63			
139.00	0.50			
139.00	1.00			
189.00	2.00			

Results		
Wtd. Mannings Coefficient	0.016	
Discharge	180.97	cfs
Flow Area	53.92	ft²
Wetted Perimeter	143.12	ft
Top Width	142.00	ft
Height	1.03	ft
Critical Depth	1.52	ft
Critical Slope	0.005233	ft/ft
Velocity	3.36	ft/s
Velocity Head	0.18	ft
Specific Energy	1.71	ft
Froude Number	0.96	
Flow is subcritical.		
Flow is divided.

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

RANGE WASH - FLOOD INSURANCE RESTUDY
FOR: CLARK COUNTY REGIONAL FLOOD CONTROL DISTRICT
BY: POST, BUCKLEY, SCHUH & JERNIGAN, INC.
JOB. NO. 51804
HEC-1 FILE: RFISA.DAT
JANUARY 1997

REVISED FOR REVISIONS TO CONFLUENCE DETENTION BASIN OUTLET
FILE REVISED WITH NEW STAGE STORAGE DISCHARGE RELATIONSHIP
REVISED DUE TO PLACEMENT OF GABIONS IN OUTLET STRUCTURE
TO IMPROVE FACTOR OF SAFETY AGAINST BUOYANCY OF STRUCTURE
REVSION SLIGHTLY REDUCES LOW LEVEL DISCHARGE CAPACITY
FROM 367 CFS TO 364 CFS AT CREST OF HIGH LEVEL WEIR

EXISTING CONDITIONS WITH WEST RANGE WASH DIVERSION DIKE, AND ALSO
WITH THE CONFLUENCE DETENTION BASIN, CURRENTLY UNDER CONSTRUCTION
STORM CENTERINGS FOR THE ENTIRE SYSTEM & FOR THE CONFLUENCE DETENTION BASIN

FEMA FORMS

FEDERAL EMERGENCY MANAGEMENT AGENCY **REVISION REQUESTOR AND COMMUNITY OFFICIAL FORM**	*O.M.B. Burden No. 3067-0148* *Expires July 31, 1997*	FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 2.13 hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

1. OVERVIEW

1. The basis for this revision request is (are): *(check all that apply)*
   - ☒ Physical change
     - ☒ Existing
     - ☒ Proposed
   - ☐ Improved methodology
   - ☐ Improved data
   - ☐ Floodway revision
   - ☐ Other _____

   Explain _____
2. Flooding Source: **Range Wash**
3. Project Name/Identifier: **West Range Wash Dike, Range Wash/Sloan Channel Confluence Detention Basin, Sloan Channel**
4. FEMA zone designations affected: **ZONE A**
   (example: A, AH, AO. A1-30, A99, AE, V, V1-30, VE, B, C, D, X)
5. The NFIP map panel(s) affected for all impacted communities is (are):

320007	**North Las Vegas, City**	**Clark**	**NV**	**32003C**	**2176 D**	**8/16/95**
320003	**Clark County**	**Clark**	**NV**	**32003C**	**2180 D**	**8/16/95**
320007	**North Las Vegas, City**	**Clark**	**NV**	**32003C**	**2180 D**	**8/16/95**
320003	**Clark County**	**Clark**	**NV**	**32003C**	**2200 D**	**8/16/95**

6. The area of revision encompasses the following types of flooding, structures, and associated disciplines: *(check all that apply)*

Types of Flooding

- ☒ Riverine
- ☐ Coastal
- ☐ Alluvial Fan
- ☐ Shallow Flooding *(e.g. Zones AO and AH)*
- ☐ Lakes

Affected by wind/wave action
- ☐ Yes
- ☐ No

- ☐ Other (describe) _____

Structures

- ☒ Channelization
- ☒ Levee/Floodwall
- ☐ Bridge/Culvert
- ☒ Dam
- ☐ Coastal
- ☒ Fill
- ☐ Pump Station
- ☐ None
- ☐ Channel Relocation
- ☐ Excavation
- ☐ Other *(describe)* _____

Disciplines*

- ☒ Water Resources
  - ☒ Hydrology
  - ☒ Hydraulics
  - ☒ Sediment Transport
  - ☐ Interior Drainage
- ☐ Structural
- ☐ Geotechnical
- ☐ Land Surveying
- ☐ Other *(describe)* **CIVIL ENGINEER**

*** Attach completed "Certification by Registered Professional Engineer and/or Land Surveyor" Form for each discipline checked. (Form 2)**

2. FLOODWAY INFORMATION

7. Does the affected flooding source have a floodway designated on the effective FIRM or FBFM? ☐ Yes ☒ No
8. Does the revised floodway delineation differ from that shown on the effective FIRM or FBFM ☐ Yes ☒ No
   If yes, give reason: _____

Attach copy of either a public notice distributed by the community stating the community's intent to revise the floodway or a statement by the community that it has notified all affected property owners and affected adjacent jurisdictions

9. Does the state have jurisdiction over the floodway or its adoption by communities participating in the NFIP?
☐ Yes ☒ No

If yes, attach a copy of a letter notifying the appropriate State agency of the floodway revision and documentation of the approval of the revised floodway by the appropriate State agency.

3. PROPOSED ENCROACHMENTS

10. With floodways:

1A. Does the revision request involve fill, new construction, substantial improvements, or other development in the floodway? ☐ Yes ☐ No

1B If yes, does the development cause the 100-year water surface elevation to increase at any location by more that 0.000 feet? ☐ Yes ☐ No

11. Without floodways:

2A. Does the revision request involve fill, new construction, substantial improvements, or other development in the 100-year floodplain? ☒ Yes ☐ No

2B If yes, does the cumulative effect of all development that has occurred since the effective SFHA was originally identified cause the 100-year water surface elevation to increase at any location by more than one foot *(or other surcharge limit if community or state has adopted more stringent criteria)?* ☐ Yes ☒ No

If the answer to either Items 1B or 2B is yes, please provide documentation that all requirements of Section 65.12 of the NFIP regulations have been met, regarding evaluation of alternatives, notice to individual legal property owners, concurrence of CEO, and certification that no insurable structures are impacted.

4. REVISION REQUESTOR ACKNOWLEDGMENT

12. Having read NFIP Regulations, 44 CFR Ch.1, parts 59, 60, 61, and 72, I believe that the proposed revision ☒ is ☐ is not in compliance with the requirements of the aforementioned NFIP Regulations.

5. COMMUNITY OFFICIAL ACKNOWLEDGMENT

13. Was this revision request reviewed by the community for compliance with the community's adopted floodplain management ordinances? ☒ Yes ☐ No

14. Does this revision request have the endorsement of the community? ☒ Yes ☐ No

If no to either of the above questions, please explain: _____

Please note that community acknowledgment and/or notification is required for all requests as outlined in Section 65.4 (b) of the NFIP Regulations.

6. OPERATION AND MAINTENANCE

15. Does the physical change involve a flood control structure (e.g., levees, floodwalls, channelization, basins, dams)?
☒ Yes ☐ No

If yes, please provide the following information for each of the new flood control structures:

A. Inspection of the flood control project will be conducted periodically by **Clark County Regional Flood Control District** (entity) with a maximum interval of **12** months between inspections.

B. Based on the results of scheduled periodic inspections, appropriate maintenance of the flood control facilities will be conducted by **City of North Las Vegas and Clark County Department of Public Works** (entity) to ensure the integrity and degree of flood protection of the structure

C. A formal plan of operation, including documentation of the flood warning system, specifications and assignments of responsibility by individual name or title, and provisions for testing the plan at intervals not less than one year, ☒ has ☐ has not been prepared for the flood control structure.

D. The community is willing to assume responsibility for ☒ performing ☒ overseeing compliance with the maintenance and operation plan of the West Range Wash Dike, Range/Sloan Confluence Det. Basin,Sloan Channel
(Name)

flood control structure. If not performed promptly by an owner other than the community, the community will provide the necessary services without cost to the Federal government.

Attach operation and maintenance plans

7. REQUESTED RESPONSE FROM FEMA

16. After examining the pertinent NFIP regulations and reviewing the document entitled " Appeals, Revisions, and Amendments to Flood Insurance Maps: A guide for Community Officials," dated January 1990, this request is for a:

X	a.	CLOMR	A letter from FEMA commenting on whether a proposed project, if built as proposed, would justify a map revision *(LOMR or PMR)*, or proposed hydrology changes *(see 44 CFR Ch.I, Parts 60, 65, and 72).*
X	b.	LOMR	A letter from FEMA officially revising the current NFIP map to show changes in floodplain, floodways, or flood elevations. LOMRs typically depict decreased flood hazards. *(see 44 CFR Ch.I Parts 60 and 65.)*
	c.	PMR	A reprinted NFIP map incorporating changes to flood plains, floodways, or flood elevations Because of the time and cost involved to change, reprint, and redistribute an NFIP map, a PMR is usually processed when a revision reflects increased flood hazards or large-scope changes. *(See 44 CFR Ch.I, Parts 60 and 65.)*
	d.	Other	Describe _____

8. FORMS INCLUDED

17. Form 2 entitled, "Certification By Registered Professional Engineer and/or Land Surveyor" must be submitted.

The following forms should be included with this request if (check the included forms):

• Hydrologic analysis for flooding source differs from that used to develop FIRM	☒ Hydrologic Analysis Form (Form 3)
• Hydraulic analysis for riverine flooding differs from that used to develop FIRM	☒ Riverine Hydraulic Analysis Form (Form 4)
• The request is based on updated topographic information or a revised floodplain or floodway delineation is requested	☒ Riverine/Coastal Mapping Form (Form 5)
• The request involves any type of channel modification	☒ Channelization Form (Form 6)
• The request involves new bridge or culvert or revised analysis of an existing bridge or culvert	☒ Bridge/Culvert Form (Form 7)
• The request involves a new levee/floodwall system	☒ Levee/Floodwall System Analysis Form (Form 8)
• The request involves analysis of coastal flooding	☐ Coastal Analysis Form (Form 9)
• The request involves coastal structures credited as providing protection from the 100-year flood	☐ Coastal Structures (Form 10)
• The request involves an existing, proposed, or modified dam	☒ Dam Form (Form 11)
• The request involves structures credited as providing protection from the 100-year flood on an alluvial fan	☐ Alluvial Fan Flooding Form (Form 12)

9. INITIAL REVIEW FEE

18. The Minimum initial review fee for the appropriate request category has been included. ☐ Yes ☒ No
Initial fee amount: $ _____

Check or money order only. Make check or money order payable to: **National Flood Insurance Program.** If paying by Visa or Mastercard please refer to the credit card information form which follows this form.

or

19. This request is for a project that is for public benefit and is primarily intended for flood loss reduction to insurable structures in identified flood hazard areas which were in existence prior to the commencement of construction of the flood control project. ☒ Yes ☐ No

or

20. This request is to correct map errors, to include the effects of natural changes within the areas of special flood hazard, or solely to provide more detailed data. ☐ Yes ☒ No

Note: I understand that my signature indicates that all information submitted in support of this request is correct.

Signature of Revision Requester

Donald W. Davis, P.E., Project Manager
Printed Name and Title of Revision Requester

Post, Buckley, Schuh, and Jernigan, Inc.
Company Name

(702) 263-7275 **January 22, 1996**
Telephone No. Date

Note: Signature indicates that the community understands, from the revision requester, the impacts of the revision on flooding conditions in the community.

Signature of Community Official

Printed Name and Title of Community Official

Community Name

Date

Does this request impact any other communities? ☒ Yes ☐ No

If yes, attach letters from all affected jurisdictions acknowledging revision request and approving changes to floodway, If applicable.

Note: Although a photograph of physical changes is not required, it may be helpful for FEMA's review.

FEDERAL EMERGENCY MANAGEMENT AGENCY **CERTIFICATION BY REGISTERED PROFESSIONAL ENGINEER AND/OR LAND SURVEYOR FORM**	*O.M.B. Burden No. 3067-0148* *Expires July 31, 1997*	FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average .23 hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

1. This certification is in accordance with 44 CFR Ch. I, Section 65.2

2. I am licensed with an expertise in **water resources (hydrology, hydraulics)**
   [example: water resources *(hydrology, hydraulics, sediment transport, interior drainage)** structural, geotechnical, land surveying.]

3. I have **14** years experience in the expertise listed above.

4. I have ☐ prepared ☒ reviewed the attached supporting data and analyses related to my expertise.

5. I ☒ have ☐ have not visited and physically viewed the project.

6. In my opinion, the following analyses and/or designs, is/are being certified:
   West Range Wash Dike, Confluence Detention Basin, Sloan Channel Owens to Charleston, Channel Lamb to Alexander

7. Based upon the following review, the modifications in place have been constructed in general concordance with plans and specifications.

   Basis for above statement: (check all that apply)
   - a. ☐ Viewed all phases of actual construction.
   - b. ☒ Compared plans and specifications with as-built survey information.
   - c. ☒ Examined plans and specifications and compared with competed projects.
   - d. ☐ Other _____

8. All information submitted in support of this request is correct to the best of my knowledge. I understand that any false statement may be punishable by fine or imprisonment under title 18 of the United States Code, Section 1001.

Name: **Donald W. Davis**
(please print or type)

Title: **Project Manager**
(please print or type)

State **Nevada**

Type of License **Civil Engineer**

_____
Signature

_____
Date

_____
Seal
(Optional)

* Specify Subdiscipline

Note: Insert not applicable (N/A) when statement does not apply.

FEDERAL EMERGENCY MANAGEMENT AGENCY **HYDROLOGIC ANALYSIS FORM**	*O.M.B. Burden No. 3067-0148* *Expires July 31, 1997*	FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 3.67 hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

Community Name: **Clark County Nevada and Incorporated Areas, City of North Las Vegas**

Flooding Source: **Range Wash**
(One form for each flooding source)

Project Name / Identifier: **Range Wash FIS Restudy**

1. HYDROLOGIC ANALYSIS IN FIS

☒ Approximate study stream (Zone A)
☐ Detailed study stream (briefly explain methodology) _____

2. REASON FOR NEW HYDROLOGIC ANALYSIS

☐ No existing analysis
☒ Improved Data *(see data revision on page 3)*
☒ Changed physical conditions of watershed *(explain)* **Major flood control facilities have been constructed or are under construction, including a diversion dike to the North Las Vegas Detention Basin and the Range Wash/Sloan Channel Confluence Detention Basin, & Sloan Channel**
☐ Alternative methodology *(justify why the revised model is better than model used in the effective FIS)*

☒ Evaluation of proposed conditions (CLOMRs only) (explain) **The Sloan Channel between Stewart Avenue and Charleston Boulevard is not yet constructed**
☐ Other _____

If a computer program/model was used in revising the hydrologic analysis, please provide a diskette with the input files for the 10-, 50-, 100- and 500-year recurrence intervals.

Only the 100-year recurrence interval need be included for SFHA designated as Zone A.

3. APPROVAL OF ANALYSIS

☒ Approval of hydrologic analysis, including the resulting peak discharge value (s) has been provided by the appropriate local, state, or Federal Agency. (i.e., **Clark County Regional Flood Control District**)
Attach evidence of approval.

☐ Approval of the hydrologic analysis is not required by any local, state, or Federal Agency.

4. REVIEW OF RESULTS

Stream: **Range Wash**

Comparison of 100-year Discharges

Location:	Drainage area (Sq. mi.) w/o dike - w/ dike - w/ DB	FIS (cfs): w/o dike - w/ dike	Revised (cfs): w/ dike - w/ DB
West Tributary at Las Vegas Blvd	49 - 11, 8_R - N/A	6,300 - 2,900	1,550
Sloan Channel at Owens	138 - 89 - 85_R	8,000 - 5,200	1,940
Sloan Channel at Las Vegas Wash	151 - 102 - 16	8,300 - 6,000	4,000
$_R$: Revised areas of Restudy			

Note: When revised discharges are not significantly different than FIS discharges, FEMA may require a confidence limits analysis on attachment D at a later date to complete the review

As is often the case with revision requests, only a portion of a stream may actually be revised or be affected by a revision. Therefore, transition to the unrevised portion is important to maintain the continuity of the study. NFIP regulations stipulate that such a transition must be assured. What is the transition from the proposed discharges to the effective discharges? Please explain how the transition was made *(attach separate sheet if necessary)*

ATTACH A COMPLETED REVIEW OF RESULTS PAGE FOR EACH FLOODING SOURCE.

Is the new hydrologic analysis being developed solely to revise the flow values presented in the FIS *(i.e. no changed hydraulic conditions)?* ☐ Yes ☒ No

If yes, does the 100-year water surface elevation change by 1.0 foot or more? ☐ Yes ☐ No

FEMA does not normally revise NFIP maps solely due to insignificant flow changes where changes in the 100-year water surface elevation are less than 1.0 foot.

5. HISTORICAL FLOODING INFORMATION

Is historical data available for the flooding source? ☐ Yes ☒ No

If yes, provide the following:

Location along flooding source: _____

Maximum peak discharge: _____ cfs

Second highest peak discharge: _____ cfs

Source of information: _____

6. GAGE RECORD INFORMATION

Location of the nearest gage to project site *(along flooding source or similar watershed: specify)*

N/A

Gaging Station: _____

Drainage area at gage: _____ mi^2

Number of years of data: _____

7. DATA REVISION

Please use the following table to list all the data and/or parameters affected by this request and identify them as new data *(New)* or as revising existing data *(Revised)*. *(If necessary, attach a separate sheet.)*

Data Parameter	New	Revised	Data Source
Basin Delineation	☐	☒	Changes due to development
Lag times	☐	☒	CCRFCD Criteria Manual
	☐	☐	
	☐	☐	
	☐	☐	

- Data source can be from Federal, State, or local government agency, or from a private source. Some State and local governments may have less strict data requirements than Federal Agencies, in which case the hydrologic data may not be accepted by FEMA unless it is demonstrated that the data give a better estimate of the flood discharge.

- Attach documentation corroborating each data source *(i.e. certified statement, report, bibliographical reference to a published document)*. In each case of a published document or a government report, providing copies of the cover and pertinent pages may be helpful.

8. METHODOLOGY FOR NEW ANALYSIS

☐ Statistical Analysis of Gage Records *(use Attachment A)*

☐ Regional Regression Equations *(use Attachment B)*

☒ Precipitation/Runoff Model *(use Attachment C)*

☐ Other *(specify; attach backup computations and supporting data)* _____

ATTACHMENT A: STATISTICAL ANALYSIS OF GAGE RECORDS

Gaging Station: _____

Gage Location (latitude and longitude): _____

	FIS:	Revised:
1. Number of years of data		
Systematic		
Historical		
2. Homogeneous data	☐ Yes ☐ No	☐ Yes ☐ No
3. Data adjustments	☐ Yes ☐ No	☐ Yes ☐ No
4. Number of high outliers		
Low outliers		
Zero events		
5. Generalized skew		
6. Station skew		
7. Adopted skew		
8. Probability distribution used (justify if log-Pearson III was not used)		
9. Transfer equations to ungaged sites		☐ Yes ☐ No
If yes, specify method		
10. Expected probability*	☐ Yes ☐ No	☐ Yes ☐ No
11. Comparison of results with other analyses	☐ Yes ☐ No	☐ Yes ☐ No
If yes, describe comparison		

*FEMA does not accept expected probability analyses for the purpose of reflecting flood hazard information in a FIS.

If any data is not available, indicate by N/A

Attach analysis including plot of flood frequency curve.

ATTACHMENT B: REGIONAL REGRESSION EQUATIONS

1. Bibliographic Reference:

_____

_____

_____

(attach a copy of title page, table of contents, and pertinent pages including equations)

2. Gaged or ungaged stream: _____

3. Hydrologic region(s): _____
Attach backup map.

4. Provide parameters, values, and source of data used to define parameters.

_____

_____

_____

		FIS:	Revised:
5.	Urbanized conditions calculations	☐ Yes ☐ No	☐ Yes ☐ No
6.	Percent of watershed urbanization	_____	_____
7.	Is the watershed controlled?	☐ Yes ☐ No	☐ Yes ☐ No
8.	Comparison with other analyses	☐ Yes ☐ No	☐ Yes ☐ No

If the answer to 5, 7, or 8, is yes, explain methodology in comments.
If data is not available, indicate by N/A.

Comments

_____

_____

_____

_____

Attach computation and supporting maps, delineating the watershed boundary and drainage area divides.

ATTACHMENT C: PRECIPITATION / RUNOFF MODEL

		FIS:	Revised:
1.	Method or model used:	HEC-1	HEC-1
	Version:	Haested 5.2	4.0
	Date:	Aug. 1988	Sept. 1990
2.	Source of Rainfall Depth:	CCRFCD	CCRFCD
3.	Source of rainfall distribution	CCRFCD	CCRFCD
4.	Rainfall duration:	6 hours	6 hours
5.	Areal adjustment to precipitation (%):	CCRFCD DARFS	CCRFCD DARFS
6.	Maximum overland flow length	500 ft	500 ft
7.	Hydrograph development method:	SCS Unit Hydrograph	SCS Unit Hydrograph
8.	Loss rate method:	SCS	SCS
	Source of soils information	SCS	SCS
	Source of land use information	1990 Aerial Photos	1995 Aerial Photos
9.	Channel routing method:	Muskingum	Muskingum
10.	Reservoir routing	☐ Yes ☒ No	☒ Yes ☐ No
11.	Baseflow considerations:	☐ Yes ☒ No	☐ Yes ☒ No
	If yes, explain how baseflow was determined:		
12.	Snowmelt considerations:	☐ Yes ☒ No	☐ Yes ☒ No
13.	Model calibration:	☐ Yes ☒ No	☐ Yes ☒ No
	If yes, explain how calibration was performed		
14.	Future land use condition:		☐ Yes ☒ No
	If yes, explain why		

NOTE: FEMA policy is to base flooding on existing conditions.
If data is not available, indicate by N/A.

Attach precipitation / runoff model, hydrologic model schematic, curve number calculations, time of concentration calculations, and supporting maps, delineating the watershed boundary and drainage area divides.

ATTACHMENT D: CONFIDENCE LIMITS EVALUATION

Stream: _____

Select one location for Confidence Limits Evaluation *(describe location)*: _____

_____

Discharge for selected location.

Exceedance Probability		FIS		Revised	
10%	(10-year)	_____	cfs	_____	cfs
2%	(50-year)	_____	cfs	_____	cfs
1%	(100-year)	_____	cfs	_____	cfs
0.2%	(500-year)	_____	cfs	_____	cfs

1% (100-year) Flood Confidence Intervals

90% Confidence Interval: 5% limit _____ cfs

95% limit _____

50% Confidence Interval: 25% limit _____

75% limit _____

If the value of the 100-year frequency flood in the FIS is beyond the 50% confidence interval but within the 90% confidence interval, does the 100-year water surface elevation change by 1.0 foot or more? ☐ Yes ☐ No

An example of confidence limits analysis can be found in Appendix 9 of Bulletin 17B.

Attach Confidence Limits Analysis.

FEDERAL EMERGENCY MANAGEMENT AGENCY **RIVERINE HYDRAULIC ANALYSIS FORM**	*O.M.B. Burden No. 3067-0148* *Expires July 31, 1997*	FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 2.25 hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

Community Name: **Clark County, Nevada and Incorporated Areas, City of North Las Vegas**

Flooding Source: **Range Wash**
(One form for each flooding source)

Project Name / Identifier: **Range Wash FIS Restudy**

1. REACH TO BE REVISED

Downstream limit: **Confluence with Las Vegas Wash**
Upstream limit: **Elkhorn Road**

2. EFFECTIVE FIS

☐ Not studied

☒ Studied by approximate methods
Downstream limit of study: Confluence with Las Vegas Wash
Upstream limit of study: Elkhorn Road

☐ Studied by detailed methods
Downstream limit of study:
Upstream limit of study:

☐ Floodway delineated
Downstream limit of study:
Upstream limit of study:

3. HYDRAULIC ANALYSIS

Why is the hydraulic analysis different from that used to develop the FIRM. *(Check all that apply)*

☐ Not studied in FIS

☐ Improved hydrologic data / analysis. Explain: Basins have been delineated in more detail and reflect recent improvements by developers.

☐ Improved hydraulic analysis. Explain:

☒ Flood control structure. Explain: Range Wash Dike has been constructed, Confluence Detention Basin has been constructed, Sloan Channel improvements have been constructed and are under construction.

☐ Other. Explain:

3. RIVERINE HYDRAULIC ANALYSIS FORM
Models Submitted

For areas which have detailed flooding:

Full input and output listings along with files on diskette (if available) for each of the models listed below (items 1, 2, 3, 4, and 5) and summary of the source of input parameters used in the models must be provided. The summary must include a complete description of any changes made from model to model (e.g. duplicate effective model to corrected effective model.) At a minimum, the Duplicate Effective (item 1) and the Revised or Post-Project Conditions (item 4) models must be submitted. See instructions for directions on when other models may be required.

For areas which do not have detailed flooding:

Only the 100-year flood profile is required. A hydraulic model is not required for areas which do not have detailed flooding; however, BFEs may not be added to the revised FIRM. If a hydraulic model is developed for the area, items 3 and 4 described below must be submitted.

If hydraulic models are not developed, hydraulic analyses for existing or pre-project conditions and revised or post-project conditions must be submitted. All calculations must be submitted for these analyses. (see item 6 below)

	Natural	Floodway
1. Duplicate Effective Model Copies of the hydraulic analysis used in the effective FIS, referred to as the effective models *(10-, 50-, 100-, and 500-year multi-profile runs and the floodway run)* must be obtained and then reproduced on the requestor's equipment to produce the duplicate effective model. This is required to assure that the effective model input data has been transferred correctly to the requestor's equipment and to assure that the revised data will be integrated into the effective data to provide a continuous FIS model upstream and downstream of the revised reach.	☐	☐
2. Corrected Effective Model The corrected effective model is the model that corrects any errors that occur in the duplicate effective model, adds any additional cross sections to the duplicate effective model, or incorporates more detailed topographic information than that used in the currently effective model. The corrected effective model must not reflect any man-made physical changes since the date of the effective model. An error could be a technical error in the modeling procedures, or any construction in the floodplain that occurred prior to the date of the effective model but was not incorporated into the effective model.	☐	☐
3. Existing or Pre-Project Conditions Model The duplicate effective or corrected model is modified to produce the existing or pre-project conditions model to reflect any modifications that have occurred within the floodplain since the date of the effective model but prior to the construction of the project for which the revision is being requested. If no modification has occurred since the date of the effective model, then this model would be identical to the corrected effective or duplicate effective model.	☐	☐
4. Revised or Post-Project Conditions Model The existing or pre-project conditions model *(or duplicate effective or corrected effective model, as appropriate)* is revised to reflect revised or post-project conditions. This model must incorporate any physical changes to the floodplain since the effective model was produced as well as the effects of the project. When the request is for proposed project this model should reflect proposed conditions.	☐	☐
5. Other: Please attach a sheet describing all other models submitted	Natural	Floodway
6. Hydraulic Analyses (Only if Hydraulic Models are not developed)	☒	☒

Please Attach all calculations for the existing or pre-project conditions and the revised or post-project conditions. Proceed to form 5, "Riverine/Coastal Mapping Form".

4. MODEL PARAMETERS (from model used to revise 100-year water surface elevation)

1. Discharges:

	Upstream limit	Downstream limit
10-year		
50-year		
100-year		
500-year		

Attach diagram showing changes in 100-year discharge

2. Explain how the starting water surface elevations were determined _____

3. Give range of friction loss coefficient *(Manning's "N")* Channel . . . . . _____

Overbanks . . . . . _____

If friction loss coefficients are different anywhere along the revised reach from those used to develop the FIRM, give location, value used in the effective FIS, and the revised values and an explanation as to how the revised values were determined.

Location	FIS	Revised

Explain: _____

4. Describe how the cross section geometry data were determined *(e.g., field survey, topographic map, taken from previous study)* and list cross sections that were added.

5. Were natural channel banks selected as the location of the left and right channel banks in the model?

☐ Yes ☐ No If no, explain why not: _____

4. MODEL PARAMETERS (Cont'd)

6. Explain how reach lengths for channel and overbanks were determined:

_____

_____

_____

_____

5. RESULTS (from model used to revise 100-year water surface elevations)

1. Do the results indicate:

   a. Water surface elevations higher than end points of cross sections? . . . . . ☐ Yes ☐ No

   b. Supercritical depth? . . . . . ☐ Yes ☐ No

   c. Critical depth? . . . . . ☐ Yes ☐ No

   d. Other unique situations . . . . . ☐ Yes ☐ No

   If yes to any of the above, attach an explanation that discusses the situation and how it is presented on the profiles, tables, and maps.

2. What is the maximum change in energy gradient between cross-sections? . . . . . _____
   Specify location . . . . . _____

3. What is the distance between the cross-sections in 2 above? . . . . . _____

4. What is the maximum distance between cross-sections? . . . . . _____
   Specify location . . . . . _____

5. Floodway determination
   a. What is the maximum surcharge allowed by the community or State? . . . . . _____ foot
   b. What is the maximum surcharge for the revised conditions? . . . . . _____ foot
   Specify location . . . . . _____
   c. What is the maximum velocity? . . . . . _____ fps
   Specify location . . . . . _____

   d. Are there any negative surcharge values at any cross-section ☐ Yes ☐ No
   If yes, the floodway may need to widen. If it is not widened, please explain and indicate the maximum negative surcharge.

Explain: _____

_____

_____

5. RESULTS (Cont'd)

6. Is the discharge value used to determine the floodway anywhere different from that used to determine the natural 100-year flood elevations? . . . . . ☐ Yes ☐ No
If yes, explain:

_____

_____

_____

7. Do 100-year water surface elevations increase at any location? . . . . . ☐ Yes ☐ No
If yes, please attach a list of the locations where the increases occur, state whether or not the increases are located on the requestor's property, and provide an explanation of the reason for the increases. *(For example: State if the increase is due to fill placed within the floodway fringe or placed within the currently adopted floodway limits)*

_____

_____

_____

Please attach a completed comparison table entitled: Water Surface Elevation Check (See page 6)

6. REVISED FIRM/FBFM AND FLOOD PROFILES

A. The revised water surface elevations tie into those computed by the effective FIS Model *(10-, 50-, 100-, and 500-year)* downstream of the project at cross-section _____ within _____ feet *(vertical)* and upstream of the project at cross section _____ within _____ feet *(vertical)*.

B. The revised floodway elevations tie into those computed by the effective FIS model, downstream of the project at cross section _____ within _____ feet *(vertical)* and upstream of the project at cross section _____ within _____ feet *(vertical)*.

C. Attach profiles, at the same vertical and horizontal scale as the profiles in the effective FIS report, showing stream bed and profiles of all floods studied (without encroachment). Also, label all cross sections, road crossings (including low chord an top-of-road data), culverts, tributaries, corporate limits, and study limits. If channel distance has changed, the stationing should be revised for all profile sheets.

D. Attach a Floodway Data Table showing data for each cross section listed in the published Floodway Data Table in the FIS report.

Proceed to Riverine / Coastal Mapping Form

FEDERAL EMERGENCY MANAGEMENT AGENCY **RIVERINE/COASTAL MAPPING FORM**	*O.M.B. Burden No. 3067-0148* *Expires July 31, 1997*	FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 1.5 hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

Community Name: **Clark County, Nevada and Incorporated Areas, City of North Las Vegas**

Flooding Source: **Range Wash**

Project Name / Identifier: **Range Wash FIS Restudy**

1. MAPPING CHANGES

1. A topographic work map of suitable scale, contour interval, and planimetric definition must be submitted showing *(indicate N/A when not applicable):*

		Included		
A.	Revised approximate 100-year floodplain boundaries (Zone A)	☒ Yes	☐ No	☐ N/A
B.	Revised detailed 100- and 500-year floodplain boundaries	☐ Yes	☐ No	☒ N/A
C.	Revised 100-year floodway boundaries	☐ Yes	☐ No	☒ N/A
D.	Location and alignment of all cross sections used in the revised hydraulic model with stationing control indicated	☒ Yes	☐ No	☐ N/A
E.	Stream alignments, road and dam alignments	☒ Yes	☐ No	☐ N/A
F.	Current community boundaries	☒ Yes	☐ No	☐ N/A
G.	Effective 100-~~and 500~~-year floodplain ~~and 100-year floodway~~ boundaries from the FIRM/~~FBFM~~ reduced or enlarged to the scale of the topographic work map	☒ Yes	☐ No	☐ N/A
H.	Tie-ins between the effective and revised 100- ~~and 500~~-year floodplains ~~and 100-year floodway~~ boundaries	☐ Yes	☐ No	☒ N/A
I.	The requestor's property boundaries and community easements	☐ Yes	☐ No	☒ N/A
J.	The signed certification of a registered professional engineer	☒ Yes	☐ No	☐ N/A
K.	Location and description of reference marks	☐ Yes	☐ No	☒ N/A
L.	Vertical datum (example: NGVD, NAVD etc.)	☒ Yes	☐ No	☐ N/A
M.	Coastal zone designations tie into adjacent areas not being revise	☐ Yes	☐ No	☒ N/A
N.	Location and alignment of all coastal transects used to revise the coastal analyses	☐ Yes	☐ No	☒ N/A

If any of the items above are marked no or N/A, please Explain:

Study includes the entire mapped reach of Range Wash by approximate methods no base flood elevations are determined.

2. What is the source and data of the updated topographic information *(example: orthophoto maps, July 1985: field survey, May 1979, beach profiles, June 1987, etc.)?* **Aerial Survey Topographic Mapping 3/15/95**

3. What is the scale and contour interval of the following work maps?

a. Effective FIS **1" = 400'** scale **4 ft** Contour interval

b. Revision Request **1" = 400'** scale **2 ft** Contour interval

NOTE: Revised topographic information must be of equal or greater detail.

4. Attach an annotated FIRM and FBFM at the scale of the effective FIRM and FBFM showing the revised 100-year and 500-year floodplains and the 100-year floodway boundaries and how they tie into those shown on the effective FIRM and FBFM downstream and upstream of the revision or adjacent to the area of revision for coastal studies.

Attach additional pages if needed.

1. MAPPING CHANGES (Cont'd)

5. Flood boundaries and 100-year water surface elevations:

Has the 100-year floodplain been shifted or increased or the 100-year water surface elevation increased at any location on the property other than the requestor's or community's? ☐ Yes ☒ No

If yes, please give the location of shift or increase and an explanation of the increase.

Shifted within community, due to more detailed and accurate topography

a. Have the affected property owners been notified of this shift or increase and the effect it will have on their property? . . . . . ☐ Yes ☒ No

If yes, please attach letters from these property owners stating they have no objections to the revised flood boundaries if a LOMR is being requested.

b. What is the number of insurable structures that will be impacted by this shift or increase? **none**

6. Have the floodway boundaries shifted or increased at any location compared to those shown on the effective FBFM or FIRM? . . . . . ☒ Yes ☐ No

If yes, explain:

Shifted within community, due to more detailed and accurate topography

7. If a V-zone has been designated, has it been delineated to extend landward to the heel of the primary frontal dune? ☐ Yes ☐ No

If no, explain:

8. Manual or digital map submission:

☒ Manual

☒ Digital

Digital map submissions may be used to update digital FIRMs (DFIRMs). For updating DFIRMs, these submissions must be coordinated with FEMA headquarters as far in advance of submission as possible.

2. EARTH FILL PLACEMENT

1. The fill is: ☒ Existing ☐ Proposed **Fill is associated with Cibola Project Case No. 95-09-1021C**

2. Has fill been / will be placed in the regulatory floodway? . . . . . ☐ Yes ☒ No
If yes, please attach complete Riverine Hydraulic Analysis Form.

3. Has fill been / will be placed in the floodway fringe *(area between the floodway and 100-year floodplain boundaries)?* . . . . . ☒ Yes ☐ No

   A. Are fill slopes for granular materials steeper than one vertical on one-and-one-half horizontal? . . . . . ☐ Yes ☒ No

   If yes, justify steeper slopes _____

   B. Is adequate erosion protection provided for fill slopes exposed to moving flood waters? *(Slopes exposed to flows with velocities of up to 5 feet per second (fps) during the 100-year flood must, at a minimum, be protected by a cover of grass, vines, weeds, or similar vegetation; slopes exposed to flows with velocities greater than 5 fps during the 100-year flood must, at a minimum, be protected by stone or rock riprap.)* . . . . . ☒ Yes ☐ No

   If no, describe erosion protection provided _____

   C. Has all fill placed in revised 100-year floodplain been compacted to 95 percent of the maximum density obtainable with the Standard Proctor Test Method or acceptable equivalent method? ☒ Yes ☐ No

   D. Can structures conceivably be constructed on the fill at any time in the future? ☒ Yes ☐ No

   If yes, provide certification of fill compaction (item C. above) by the community's NFIP permit official, a registered professional engineer, or an accredited soils engineer.

4. Has fill been / will be placed in a V-zone? ☐ Yes ☒ No

   If yes, is the fill protected from erosion by a flood control structure such as a revetment or seawall? ☐ Yes ☐ No

   If yes, attach the coastal structures form.

FEDERAL EMERGENCY MANAGEMENT AGENCY **CHANNELIZATION FORM**	*O.M.B. Burden No. 3067-0148* *Expires July 31, 1997*	FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 1.75 hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

Community Name: **Clark County, Nevada and Incorporated Areas, City of North Las Vegas**

Flooding Source: **Range Wash**

Project Name / Identifier: **Range Wash FIS Restudy Channelization associated with Sloan Channel**

1. EXTENT OF CHANNELIZATION

Downstream limit: **Charleston Boulevard**

Upstream limit: **Owens Avenue**

2. CHANNEL DESCRIPTION

1. Describe the inlet to the channel
Continuation of Existing Concrete Channel

2. Briefly describe the shape of the channel *(both cross sectional and planimetric configuration)* and its lining *(channel bottom and sides)* **Concrete lined trapezoidal channel, 60 ft base width, 6.6 ft deep, 2:1 side slopes,**

3. Describe the outlet from the channel
Bridge and concrete apron at Charleston Boulevard

4. The channelization includes:

- ☐ Levees *(Attach Levee Form)*
- ☐ Drop structures
- ☐ Superelevated sections
- ☒ Transitions in cross section geometry
- ☐ Debris basin/detention basin
- ☐ Energy Dissipater
- ☐ Other

5. Attach the following:

a. Certified engineering drawings showing channel alignment and locations of inlet, outlet, and items checked in item 4

b. Typical cross sections and profiles of channel banks and invert

3. HYDRAULIC CONSIDERATIONS

1. What is the 100-year discharge? . . . . . **3,300 used in model** cfs

2. Do the cross sections in the hydraulic model match the typical cross sections in the plans? ☒ Yes ☒ No

3. Are the channel banks higher than the 100-year flood elevations everywhere? . . . . . ☒ Yes ☐ No

4. Are the channel banks higher than the 100-year flood energy grade lines everywhere? . . . ☒ Yes ☐ No

5. Is the land on both sides of the channel above the adjacent 100-year flood elevation at all points along the channel? . . . . . ☒ Yes ☐ No

6. What is the range of freeboard . . . . . **1.5** — **'1.67** feet

7. What is the range of the 100-year flood velocities? . . . . . **7** — **18** ft/sec

8. What is the lining type? (both bottom and sides) **Concrete**
   Explain how the channel lining prevents erosion and maintains channel stability *(attach documentation)*

9. What is the design elevation in the channel based on?

   ☒ Subcritical flow
   ☐ Critical flow
   ☒ Supercritical flow
   ☐ Energy grade line

   Is 100-year flood profiles based on the above type of flow? . . . . . ☐ Yes ☒ No

   If no, explain: Profiles included in the Sloan Channel Predesign Report are based on the above types of flow. No base flood elevations are determined for this area.

10. Is there the potential for a hydraulic jump at the following locations?

    Inlet to the channel . . . . . ☐ Yes ☒ No
    Outlet of the channel . . . . . ☐ Yes ☒ No
    At Drop Structures . . . . . ☒ Yes ☐ No
    At Transitions . . . . . ☐ Yes ☒ No
    At other locations. Explain

    If the answer to any of the above is yes, please explain how the hydraulic jump is controlled and the effects of the hydraulic jump on the stability of the channel.

    Explain: **Jumps are mild at upstream end of road crossing structures and are contained within the concrete channel section**

4. SEDIMENT TRANSPORT CONSIDERATIONS

1. A. Is there any indication from historical records that sediment transport (including scour and deposition) can affect the 100-year water surface elevations and/or the capacity of the channel? . . . . . ☐ Yes ☒ No

   B. Based on the conditions of the watershed and stream bed, is there a potential for sediment transport (including scour and deposition) to affect the 100-year water surface elevations and/or the capacity of the channel? . . . . . ☐ Yes ☒ No

2. If the answer to either 1A or 1B is yes:

   A. What is the estimated sediment (bed) load?
   _____ cfs (attach gradation curve)

   Explain method used to estimate load _____

   _____

   _____

   _____

   _____

   B. Is the 100-year flood velocity anywhere within the channel less than the 100-year flood velocity of the inlet? ☒ Yes ☐ No

   C. Will sediment accumulate anywhere within the channel? ☐ Yes ☒ No

   D. Will deposition or scour occur at or near the inlet? ☐ Yes ☒ No

   E. Will deposition or scour occur at or near the outlet? ☒ Yes ☐ No

Attach documentation showing affects on the hydrologic and hydraulic analyses

   Explain method used to estimate load _____

   _____

   _____

   _____

   _____

   B. Is the 100-year flood velocity anywhere within the channel less than the 100-year flood velocity of the inlet? ☒ Yes ☐ No

   C. Will sediment accumulate anywhere within the channel? ☐ Yes ☒ No

   D. Will deposition or scour occur at or near the inlet? ☐ Yes ☒ No

   E. Will deposition or scour occur at or near the outlet? ☒ Yes ☐ No

Attach documentation showing affects on the hydrologic and hydraulic analyses

FEDERAL EMERGENCY MANAGEMENT AGENCY **BRIDGE / CULVERT FORM**	*O.M.B. Burden No. 3067-0148* *Expires July 31, 1997*	FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 2.0 hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

Community Name: **Clark County, Nevada and Incorporated Areas, City of North Las Vegas**

Flooding Source: **Range Wash**

Project Name / Identifier: **Range Wash FIS Restudy**

1. IDENTIFIER

1. Name of roadway, railroad, etc.: **Washington Ave.**
2. Location of bridge/culvert along flooding source (in terms of stream distance or cross-section identifier): **Channel Station 35+45.61 to 37+75.36**
3. This revision reflects *(check one of the following):*

☐ New bridge/culvert not modeled in the FIS

☐ Modified bridge/culvert previously modeled in the FIS

☒ New analysis of bridge/culvert previously modeled in the FIS

(Explain why new analysis was performed) New design flow based on construction of Range Wash/Sloan Channel Confluence Detention Basin upstream

2. BACKGROUND

Provide the following information about the structure:

1. Dimension, material, and shape (e.g. two 10 x 5 feet reinforced concrete box culvert; three 30-foot span bridge with 2 rows of 3-foot diameter circular piers; 40-foot wide ogee shape spillway) **Bridge 2 continuous 2 ft wide piers on concrete trapezoidal channel with 60' base width and 1.5:1 Side Slope**
2. Entrance geometry of culvert/type of bridge opening (e.g. 30° - 75° wing walls with square top edge, sloping embankments and vertical abutments) **Channel Configuration contiuous through bridge Side slopes transition from 2:1 to 1.5:1 in 50 ft**
3. Hydraulic model used to analyze the structure *(e.g., HEC-2 with special bridge routine, WSPRO, HY8)* **HEC-2 with special bridge routine**

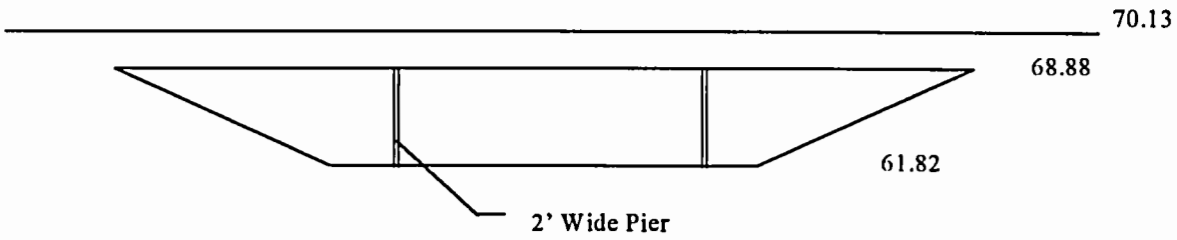
If different than hydraulic analysis for the flooding source, justify why the hydraulic analysis used for the flooding source could not analyze the structure(s). *(Attach justification)*

Note: If any items do not apply to submitted hydraulic analysis, indicate by N/A

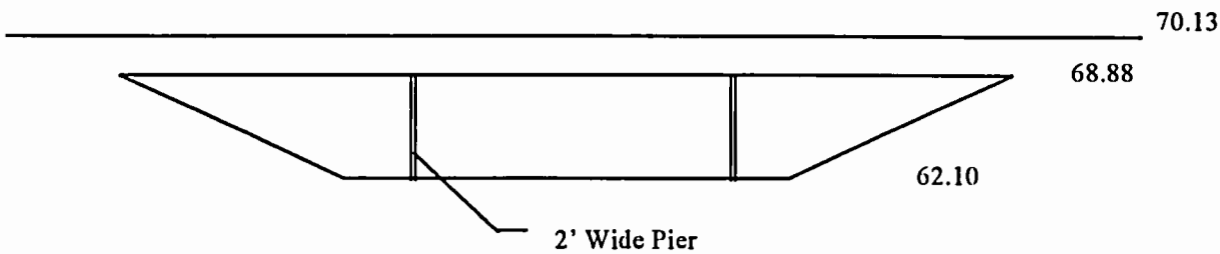
*** One form per new/revised bridge/culvert**

3. ANALYSIS

Sketch the downstream face of the structure together with the road profile. Show, at a minimum, the maximum low chord elevation, invert elevation, minimum top of road elevation, and ineffective flow widths.



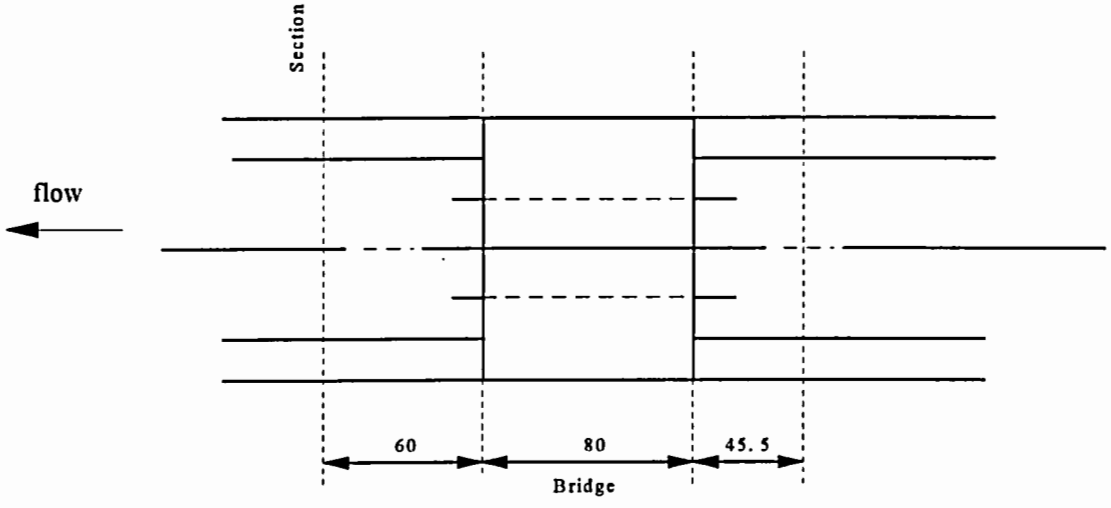
Sketch the upstream face of the structure together with the road profile. Show, at a minimum, the maximum low chord elevation, invert elevation, and minimum top of road elevation.



3. ANALYSIS (Cont'd)

Sketch the plan view of the structure(s). Show, at a minimum, the skew angle, cross-section locations, distances between cross sections, and length of structure(s).

See: Improvement Plans for Sloan Channel Owens Ave. to Stewart Ave.
Sheet C-6, 6 of 14



Attach plans of the structure(s) certified by a registered Professional Engineer.

Culvert length or bridge width (ft)	**80 ft**
Calculated culvert/bridge area (ft^2) by the hydraulic model, if applicable	**234 SF**
Total culvert/bridge area (ft^2)	**437 SF**

Elevations Above Which Flow is Effective for Overbanks

	Left Overbank	Right Overbank
Upstream face	70.7	70.7
Downstream face	70.7	70.7

Minimum Top of Road Elevation

	Left Overbank	Right Overbank
Upstream face	70.13	70.13
Downstream face	70.13	70.13

100-year Elevations	Water Surface Elevations	Energy Gradient Elevations
Upstream face	66.13	68.74
Downstream face	65.41	68.49

Discharge	Low Flow	Pressure Flow	Weir Flow	Total Flow
Amount of flow through/over the structure(s) (cfs)	3300	0	0	3300

The maximum depth of flow over the roadway/railroad (ft.) . . . . . _____

Weir length (ft . . . . . _____

Top Widths	Total Floodplain Width	Total Effective Flow Width	Floodway Width
Upstream face			
Downstream face			

Flow contained in 80 ft wide channel
Approximate Methods

3. ANALYSIS (Cont'd)

Loss Coefficients

Entrance loss coefficient	*
Manning's "n" value assigned to the structure(s)	0.015
Friction loss coefficient through structure(s)	0.015
Other loss coefficients (e.g. bend manhole, etc.)	*
Total loss coefficient	1.27
Weir coefficient	3
Pier coefficient	0.9
Contraction loss coefficient	0.2
Expansion loss coefficient	0.4

4. SEDIMENT TRANSPORT CONSIDERATIONS

1. A. Is there any indication from historical records that sediment transport *(including scour and deposition)* can affect the 100-year water surface elevations? . . . . . ☐ Yes ☒ No

   B. Based on the conditions *(such as geomorphology, vegetative cover and development of watershed and stream bed, and bank conditions)*, is there a potential for debris and sediment transport *(including scour and deposition)* to affect the 100-year water surface elevations and/or conveyance capacity through the bridge/culvert? . . . . . ☐ Yes ☒ No

2. If the answer to either 1A or 1B is yes:

   A. What is the estimated sediment *(bed material)* load?
   _____ cfs *(attach gradation curve)*

   Explain method used to estimate the sediment transport and depth of scour and /or deposition _____

   B. Will sediment accumulate anywhere through the bridge/culvert? ☐ Yes ☐ No

   If yes, explain the impact on the conveyance capacity through the bridge/culvert? _____

5. FLOODWAY ANALYSIS

Explain method of bridge encroachment (Floodway run) N/A

5. FLOODWAY ANALYSIS (Cont'd)

Comments *(explain any unusual situations):*

Attach analysis.

FEDERAL EMERGENCY MANAGEMENT AGENCY **BRIDGE / CULVERT FORM**	*O.M.B. Burden No. 3067-0148* *Expires July 31, 1997*	FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 2.0 hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. FEDERAL EMERGENCY MANAGEMENT AGENCY **BRIDGE / CULVERT FORM**	*O.M.B. Burden No. 3067-0148* *Expires July 31, 1997*	FEMA USE ONLY

PUBLIC BURDEN DISCLOSURE NOTICE

Public reporting burden for this form is estimated to average 2.0 hours per response. The burden estimate includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the needed data, and completing and reviewing the form. Send comments regarding the accuracy of the burden estimate and any suggestions for reducing this burden, to: Information Collections Management, Federal Emergency Management Agency, 500 C Street, S.W., Washington, DC 20472; and to the Office of Management and Budget, Paperwork Reduction Project (3067-0148), Washington, DC 20503.

Community Name: **Clark County, Nevada and Incorporated Areas, City of North Las Vegas**

Flooding Source: **Range Wash**

Project Name / Identifier: **Range Wash FIS Restudy**

1. IDENTIFIER

1. Name of roadway, railroad, etc.: **Stewart Avenue**
2. Location of bridge/culvert along flooding source (in terms of stream distance or cross-section identifier): **Channel Station 88+40 to 89+40**
3. This revision reflects *(check one of the following):*

   ☐ New bridge/culvert not modeled in the FIS

   ☐ Modified bridge/culvert previously modeled in the FIS

   ☒ New analysis of bridge/culvert previously modeled in the FIS

   (Explain why new analysis was performed) New design flow based on construction of Range Wash/Sloan Channel Confluence Detention Basin upstream

2. BACKGROUND

Provide the following information about the structure:

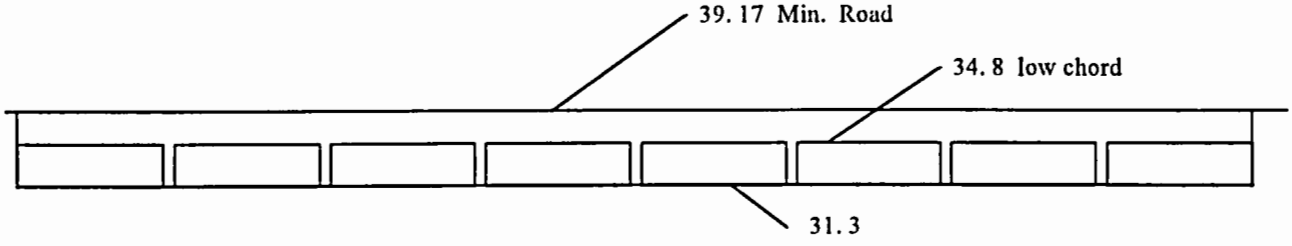
1. Dimension, material, and shape (e.g. two 10 x 5 feet reinforced concrete box culvert; three 30-foot span bridge with 2 rows of 3-foot diameter circular piers; 40-foot wide ogee shape spillway) **8 - 10' x 3.5' RCBs**
2. Entrance geometry of culvert/type of bridge opening (e.g. 30° - 75° wing walls with square top edge, sloping embankments and vertical abutments) **Channel side walls transition from 2:1 side slope to vertical**
3. Hydraulic model used to analyze the structure *(e.g., HEC-2 with special bridge routine, WSPRO, HY8)* **HEC-2 with special bridge routine**

If different than hydraulic analysis for the flooding source, justify why the hydraulic analysis used for the flooding source could not analyze the structure(s). *(Attach justification)*

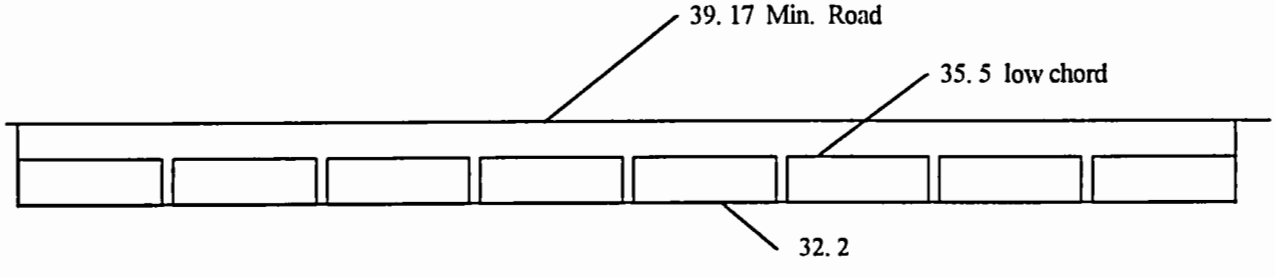
Note: If any items do not apply to submitted hydraulic analysis, indicate by N/A
*** One form per new/revised bridge/culvert**

3. ANALYSIS

Sketch the downstream face of the structure together with the road profile. Show, at a minimum, the maximum low chord elevation, invert elevation, minimum top of road elevation, and ineffective flow widths.

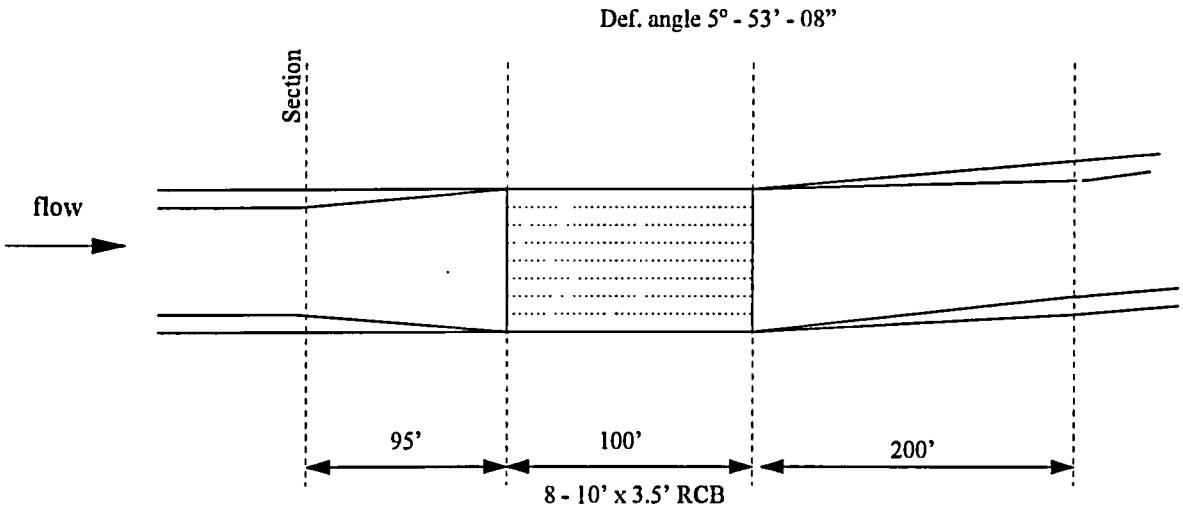


Sketch the upstream face of the structure together with the road profile. Show, at a minimum, the maximum low chord elevation, invert elevation, and minimum top of road elevation.



Sketch the plan view of the structure(s). Show, at a minimum, the skew angle, cross-section locations, distances between cross sections, and length of structure(s).

See: Improvement Plans for Sloan Channel Owens Ave. to Stewart Ave. Sheet C-10, 10 of 14 & Stewart to Las Vegas Wash Sheet C-4, 4 of 9



Attach plans of the structure(s) certified by a registered Professional Engineer.

Culvert length or bridge width (ft)	**100 ft**
Calculated culvert/bridge area (ft^2) by the hydraulic model, if applicable	**280 SF**
Total culvert/bridge area (ft^2)	**280 SF**

Elevations Above Which Flow is Effective for Overbanks

	Left Overbank	Right Overbank
Upstream face	39.17	39.17
Downstream face	39.17	39.17

Minimum Top of Road Elevation

	Left Overbank	Right Overbank
Upstream face	39.17	39.17
Downstream face	39.17	39.17

100-year Elevations	Water Surface Elevations	Energy Gradient Elevations
Upstream face	36.72	38.7
Downstream face	35.82	37.8

Discharge	Low Flow	Pressure Flow	Weir Flow	Total Flow
Amount of flow through/over the structure(s) (cfs)	0	3300	0	3300

The maximum depth of flow over the roadway/railroad (ft.) . . . . . _____

Weir length (ft . . . . . _____

Top Widths	Total Floodplain Width	Total Effective Flow Width	Floodway Width
Upstream face			
Downstream face			

Flow contained in 80 ft wide channel
Approximate Methods

3. ANALYSIS (Cont'd)

Loss Coefficients

Entrance loss coefficient	*
Manning's "n" value assigned to the structure(s)	0.015
Friction loss coefficient through structure(s)	0.015
Other loss coefficients (e.g. bend manhole, etc.)	*
Total loss coefficient	1.27
Weir coefficient	3
Pier coefficient	0.9
Contraction loss coefficient	0.3
Expansion loss coefficient	0.5

4. SEDIMENT TRANSPORT CONSIDERATIONS

1. A. Is there any indication from historical records that sediment transport *(including scour and deposition)* can affect the 100-year water surface elevations? . . . . . ☐ Yes ☒ No

   B. Based on the conditions *(such as geomorphology, vegetative cover and development of watershed and stream bed, and bank conditions)*, is there a potential for debris and sediment transport *(including scour and deposition)* to affect the 100-year water surface elevations and/or conveyance capacity through the bridge/culvert? . . . . . ☐ Yes ☒ No

2. If the answer to either 1A or 1B is yes:

   A. What is the estimated sediment *(bed material)* load?
   _____ cfs *(attach gradation curve)*

   Explain method used to estimate the sediment transport and depth of scour and /or deposition _____

   B. Will sediment accumulate anywhere through the bridge/culvert? ☐ Yes ☐ No

   If yes, explain the impact on the conveyance capacity through the bridge/culvert? _____

5. FLOODWAY ANALYSIS

Explain method of bridge encroachment (Floodway run) N/A

5. FLOODWAY ANALYSIS (Cont'd)

Comments *(explain any unusual situations):*

Attach analysis.

APPENDIX G

OFFICIALLY ADOPTED MAINTENANCE AND OPERATIONS PLAN

The Operations and Maintenance Manual for Clark County Regional Flood Control District Facilities is included in the TSDN Volume 3, Section 5.3.7

A flood control facility maintenance plan and budget is approved each year for regional flood control facilities. Attached, herein, is the work program for fiscal year 1996-1997 for the Range Wash. As indicated, Mr. Gil Suckow of Clark County Public Works is the responsible local community official for the Range Wash Area.

REGIONAL FLOOD CONTROL DISTRICT MAINTENANCE WORK PROGRAM

Entity: Clark County 1996 - 97 **Date Prepared:** February 7, 1996

Facility: CLA05 - Las Vegas Range Wash

Force Account/ Contract	Activity	Approved Work Plan $ Amount	Amended Work Plan $ Amount	Percent Complete	Scheduled Completion Date
	5 Inspect Channels	$3,000			
	10 Clean and Reshape Channels	$20,000			
	15 Repair Lined Channel	$10,000			
	20 Provide/Maintain Erosion Control				
	25 Clean & Inspect Detention Debris Basins	$5,000			
	30 Erosion Repair				
	35 Fence Repair	$3,000			
	40 Vegetation Control - Chemical	$12,000			
	45 Vegetation Control - Mechanical				
	50 Maintain Access Road	$3,000			
	55 Clean & Inspect Inlet/Outlet Structures	$500			
	60 Repair Inlet/Outlet Structures				
	65 Clean Storm Sewer Lines				
	70 Storm Sewer Repair				
	75 Clean/Flush Culverts & Bridges				
	80 Miscellaneous Work Activities	$7,700			
	85 Engineering				
	TOTALS	$64,200
